1. Introduction

Since the spring of 1951, the writers have been engaged in the gravity survey along the lines of precise levels throughout Japan by means of a WORDEN gravimeter.

The net work of the lines of precise levels covers the whole country pretty densely as shown in Fig. 1 of Part I, and the bench marks are laid at an average distance of 2 km. along these level lines. We are measuring the gravity value at every other one of the bench marks. The results that were obtained in the Shikoku and Chûgoku districts were already published as Parts I and II of these serial reports (TSUBOI et al.: 1953, 1954).

The present report is the fourth of them and is concerned particularly with the results obtained in the Kinki District (TSUBOI et al.: 1953).

2. Lines of Precise Levels in the Kinki District

The Kinki District occupies the middle western part of Honshû, the main island of Japan (Fig. 9). The district is approximately 33,000 km² in area and comprises seven administrative prefectures, viz. (23) Mie, (24) Shiga, (25) Kyôto, (26) Ôsaka, (27) Hyôgo, (28) Nara and (29) Wakayama.

The lines of precise levels in this district, along which we measured gravity values are shown in Fig. 1 with the prefecture boundaries. The lines are altogether about 2,000 km. in length, and at 480 points along them, the gravity values were determined. In this number are included several identifiable points, such as local weather stations, of which the

altitudes are known with a sufficiently high accuracy for the purpose of our gravity reductions. The number of points at which the gravity values were determined in each of the seven prefectures is as in Table I. The measurements were made in June, July, November, and December, 1951, and partly in April, 1953.

3. Method of Calculations

Our methods of measurements and reductions are similar to those described in Parts I and II and no further comments need be added. However, we must state that no attempt has been made to adjust the measured gravity values by simultaneous net calculations. In our actual process, we covered the whole length of the lines of measurements by making a gravimetric loop for each section of the lines successively in order to make the drift correction of the gravimeter spring possible. These small loops are numbered as illustrated in Fig. 1. We determined the gravity values at the points along each one of the loops separately and the results are merely connected in succession. This process cannot be called a very rational one, but owing to unavoidable circumstances regarding transportation facilities on the one hand and to the rather urgent demand for a general picture of the distribution of the gravity anomalies on the other, we have been compelled to adopt the process stated above. Although we do not claim that our results show the highest attainable accuracy, it is not likely that any difference in the process

Table II. Apparent Rate of Drift for Various Loops.

Routes	Residual (0.01 mgal.)	Time (hour)	R (mgal./hour)
4 ₁	561	67.5	0.0831
5	145	15.3	0.0942
6 ₁	762	112.6	0.0687
6 ₂	61	9.3	0.0656
6 ₃	207	24.8	0.0835
6 ₄	440	46.1	0.0954
7	99	13.0	0.0762
8 ₁	99	26.9	0.0368
8 ₂	11	2.4	0.0458
8 ₃	14	7.7	0.0182
9 ₁	124	15.6	0.0795
9 ₂	72	9.5	0.0758
9 ₃	38	6.2	0.0613
10 ₁	42	10.6	0.0396
10 ₂	22	5.5	0.0407
10 ₃	55	10.2	0.0539
10 ₄	19	7.4	0.0257

of reduction will sensibly alter the final results. It is of course our wish to make a simultaneous net adjustment when the survey over the whole country is completely finished.

Our WORDEN gravimeter has been working with admirable perfectness. But the rate of drift of the gravimeter spring apparently differed notably from one loop to another. It will be interesting to compare the rate for each of the loops given in Table II.

4. Results

The gravity values at all the stations are given in Tables III~IX for each of the loops separately. In Tables X~XVI the materials are arranged synoptically according to the seven prefectures separately. The explanations of the Tables precede them. The lines of equal BOUGUER anomalies based on the International Gravity Formula are shown in Fig. 9, with 2 mgal. intervals. The figure is in the pocket attached to the back cover. The positions of the contour lines are accurate where they meet the lines of precise levels but obviously no great accuracy can be claimed for those in the intervenient parts.

Reserving the geophysical interpretations of the distribution of the BOUGUER anomalies for future studies, we will briefly enumerate only the especially notable facts in Fig. 9.

1) The BOUGUER anomaly increases both towards north and south. On the Japan Sea coast, a positive anomaly of 48 mgal. was found, while on the Pacific coast, positive anomaly of as large as 153 mgal. was found. Along the Japan Sea coast, the isoanomaly lines are roughly parallel to the coast line, except for the western part of the Bay of Wakasa.

2) It has been known geologically that the Median Tectonic Line runs about the middle of the island of Shikoku in WSW-ENE direction and keeping almost the same trend, crosses the southern part of the Kinki District. It is interesting to note that the isoanomaly lines in the southern part of this district do not perfectly agree in trend with the geological structure of it. It is rather surprising that while the gravity anomalies in Shikoku so clearly suggest the anomalous subterranean density distribution which must be closely related to this tectonic line, those in the Kinki District apparently do not.

3) There is an area near the city of Ôsaka in which the anomaly is minimum. Probably this may be related to the alluvial deposits with small densities on which the city is situated.

4) Almost perfectly conforming to the shape of Lake Biwa, there is an area of conspicuous negative anomaly. That Lake Biwa is a depression basin has been known from geological as well as from geomorphological studies. The strong negative gravity anomaly here suggests that the amount of depression of the earth's crust is larger than indicated by the present surface relief. Also the isoanomaly lines indicate that the dip of depression is steep on the west side while it is less so on the east side.

5. Acknowledgements

We cannot close this report without expressing our sincere gratitude to the many officials and individuals who helped us in various ways in accomplishing this survey. Particularly, we wish to thank the Ministry of Education for financial support. Mrs. S. INOUE and Miss K. SEKI have helped us greatly in numerical computations and in preparing the present paper. We acknowledge gratefully their help.

Explanation of Tables

Tables III-IX Results along Each of the Routes

Pref.	Prefecture
No.	Number of Measurement
B.M.	Bench Mark Number
Time	Time of Measurement
$\sum \delta T$	Net Time needed to arrive at the Station from the Starting Point
LD	Large Dial Reading
SD	Small Dial Reading
$0.9150 \times SD$	Conversion of Small Dial Reading to 0.01 mgal.
h	Height of the Gravimeter above the Bench Mark Head
$0.3086 \times h$	Free-air Reduction to the Bench Mark Head
$E.T.$	Correction for the Earth Tides (Factor 1.20)
Drift	Correction for Drift
$\sum \delta g$	Gravity Difference from the Starting Point
g	Gravity Value (corrected for Drift and Earth Tides)

Tables X-XVI Synoptic Results for Each of the Prefectures

φ	Latitude
λ	Longitude
H	Height of the Bench Mark above the Sea Level
g	Gravity Value (Corrected for Drift and Earth Tides)
g_0	Gravity Value after the Free-air Reduction
g_0''	Gravity Value after the BOUGUER Reduction
γ	Normal Gravity
Δg_0	Free-air Anomaly
$\Delta g_0''$	BOUGUER Anomaly

ウォルドン重力計による日本全国の重力測定

第五報 近畿地方

坪井忠二・実川 顕・田島広一

これは、近畿地方における測定結果をまとめたものである。測定と計算との方法は、第一報のそれとほとんど同じであるから、こゝにはくりかえさない。結果は第 III 表～第 IX 表（ルート別）、第 X 表～第 XVI 表（県別）に示してある。ブーゲー異常の分布は、第 9 図に示してある。

第 9 図からわかる主なことから、次のとおりである。

1) ブーゲー異常 $\Delta g_0''$ は、北方すなわち日本海の方へ向かって、あるいは南方すなわち太平洋の方へ向かって、共に大きくなる。日本海沿岸には $\Delta g_0'' = +48 \text{ mgal.}$ の所があり、太平洋岸には $+153 \text{ mgal.}$ の所がある。日本海沿岸では、等異常線は海岸線とはば並行している。たゞ若狭湾の西方においては、この傾向は稍乱れている。

2) 中央構造線は、WSW-ENE の方向を以て四国の中央部を走り、同じ方向を保って紀伊半島を横断していることが知られている。しかし、近畿地方南部における等異常線の方法は、上記の構造線の方法とは一致していない。これは興味のあることである。四国地方における重力異常は、中央構造線と密接に関係があると考えられるような地下異常質量分布を示しているのに対して、近畿地方においては、そうでない。これは注目すべきことである。

3) 大阪の近くに、 $\Delta g_0''$ が極小になっている所がある。これはその下にある密度の小さい沖積層の影響であると考えられる。

4) 琵琶湖の形とほとんど完全に一致して、 $\Delta g_0''$ が負の異常域がある。琵琶湖が陥落地域であることは知られているが、こゝの重力の負異常の大きさから考えると、この陥落の量は、現在の地形が示すよりも大きいものである。陥落面の勾配は西辺では東へ向かって急、東辺では西へ向かって緩いである。
