## Chapter 1 General Introduction

Fullerene ${ }^{1}$-transition metal complexes have received much attention, since these complexes could have the advantages of both fullerene and transition metal moieties and could act as functional molecules. Such interests are mainly based on the bulky spherical structure ${ }^{2}$ of fullerene, the catalytic activities ${ }^{3}$ of transition metal moieties, and the electronic and magnetic properties ${ }^{4}$ of both fullerene and transition metal units. For these reasons, many fullerene-transition metal complexes have been synthesized. ${ }^{5}$ These complexes consist mainly of three types of structures as shown below (Figure 1-3).

[^0]1. Cocrystals between fullerene and transition metal complexes.

In view of its oxidation potential, ferrocene is incapable of reducing $\mathrm{C}_{60}$ to the corresponding anion. By recrystallization of $\mathrm{C}_{60}$ and ferrocene, cocrystals $\mathrm{C}_{60} \cdot 2\left(\mathrm{FeCp}_{2}\right)(\mathbf{I})^{6}$ can be obtained (Figure 1). While cocrystals $\mathrm{C}_{60} \cdot 2\left(\mathrm{FeCp}_{2}\right)(\mathbf{I})$ have van der Waals contact between ferrocene and fullerene, there is no electronic communication between $\mathrm{C}_{60}$ and ferrocene as expected. By mixing $\mathrm{C}_{60}$

[^1]precipitates $\mathrm{C}_{60}\left\{\mathrm{Co}^{\mathrm{II}}(\mathrm{OEP})\right\} \cdot \mathrm{CHCl}_{3}$ (II) ${ }^{7}$ were obtained (Figure 1). X-ray crystallographic studies revealed that the cobalt atom is not coordinated to any part of the fullerene molecule. Namely, the distances between the cobalt atoms and adjacent carbon atoms are in a range of 2.7-2.9 $\AA$, which is too long to represent any chemical bonding between the cobalt atoms and adjacent carbon atoms of fullerene. However, it is possible that there is some charge transfer between the two components.

As the example in Figure $2\left(\mathbf{I I I}^{8}\right.$ and $\left.\mathbf{I V}^{9}\right)$, there are fullerene-transition metal complexes bearing a tether to connect fullerene and a transition metal. In the fullerene-linkage-ferrocene type molecule III, the lifetime of photoinduced charge separation is $2.5 \mu \mathrm{~s}$. Complex IV was synthesized as an artificial photosynthetic model. It was found that the rate of charge recombination of IV caused by photoinduced charge separation became smaller than that of the corresponding quinone-linkage-porphyrin molecule.

Fullerene can coordinate in an $\eta^{2}$-fashion to a metal atom [Figure 3, complexes $\quad\left(\eta^{2}-\mathrm{C}_{60}\right) \mathrm{Pt}_{( }\left(\mathrm{PPh}_{3}\right)_{2} \quad(\mathrm{~V}){ }^{10}, \quad\left(\mathrm{C}_{60}\right)\left[\mathrm{Pt}\left\{\mathrm{P}\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)_{3}\right\}_{2}\right]_{6} \quad(\mathrm{VI}){ }^{11}$ and

[^2]$\left.\left(\mu^{3}-\eta^{2}, \eta^{2}, \eta^{2}-\mathrm{C}_{60}\right) \mathrm{Ru}_{3}(\mathrm{CO})_{9}(\mathrm{VII})^{12}\right]$. By mixing of $\mathrm{C}_{60}$ and $\left(\mathrm{Ph}_{3} \mathrm{P}\right)_{2} \mathrm{Pt}\left(\eta^{2}-\mathrm{C}_{2} \mathrm{H}_{4}\right)$ in solution, $\left(\eta^{2}-\mathrm{C}_{60}\right) \operatorname{Pt}\left(\mathrm{PPh}_{3}\right)_{2}(\mathbf{V})$ formed. This was the first example of the $\eta^{2}$-fullerene-transition metal complex. Multiple coordination of metal atoms to $\mathrm{C}_{60}$ has been examined for the reaction of $\mathrm{Pt}\left(\mathrm{PEt}_{3}\right)_{4}$ with $\mathrm{C}_{60}$. With an excess of $\mathrm{Pt}\left(\mathrm{PEt}_{3}\right)_{4}$, a hexaaddition product $\left(\mathrm{C}_{60}\right)\left[\mathrm{Pt}\left\{\mathrm{P}\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)_{3}\right\}_{2}\right]_{6}$ (VI) was obtained. The six platinum atoms coordinated to C-C bonds at 6:6 ring junction are arranged in an octahedral manner around the fullerene core. A tri-nuclear ruthenium complex $\left(\mu^{3}-\eta^{2}, \eta^{2}, \eta^{2}-\mathrm{C}_{60}\right) \mathrm{Ru}_{3}(\mathrm{CO})_{9}(\mathrm{VII})$, which was obtained in $4 \%$ yield by heating of $\mathrm{C}_{60}$ and $\mathrm{Ru}_{3}(\mathrm{CO})_{12}$, reveals a hexahapto coordination mode of the fullerene. The ruthenium atoms are attached to the 6:6 ring junctions. These complexes $\quad\left[\left(\eta^{2}-\mathrm{C}_{60}\right) \operatorname{Pt}\left(\mathrm{PPh}_{3}\right)_{2} \quad(\mathrm{~V}), \quad\left(\mathrm{C}_{60}\right)\left[\mathrm{Pt}\left\{\mathrm{P}\left(\mathrm{C}_{2} \mathrm{H}_{5}\right)_{3}\right\}_{2}\right]_{6} \quad(\mathbf{V I}) \quad\right.$ and $\left.\left(\mu^{3}-\eta^{2}, \eta^{2}, \eta^{2}-\mathrm{C}_{60}\right) \mathrm{Ru}_{3}(\mathrm{CO})_{9}(\mathrm{VII})\right]$ are stabilized by the back-donation from electron-rich transition metal moieties to $\mathrm{C}_{60}$. Whereas there are some electronic communications between transition metals and fullerene moiety, these $\eta^{2}$-complexes have several problems. One is the difficulty of synthesizing fullerene-transition metal complexes with high valent transition metals because of the weakness of the back-donation from transition metal moieties to

Fagan, P. J.; Calabrese, J. C.; Malone, B. In Fullerenes, Synthesis, Properties and Chemistry of Large Carbon Clusters; Hammond, G. S.; Kuck, V. J. Eds.; ACS symposium Series 481; American Chemical Society: Washington DC. 1992, 177.

${ }^{12}$ (a) Hsu, H. -F.; Shapley, J. R. J. Am. Chem. Soc. 1996, 118, 9192. (b) Lee, K.; Has, H. -F.; Shapley, J. R. Organometallics 1997, 16, 3876.
fullerenes. The other problem is that the reaction gives many products (regioisomers or compounds with different numbers of transition metal moieties). This problem causes difficulty in separation and low yields.

One of the most important organometallic compounds is ferrocene, ${ }^{13}$ which was discovered half a century ago. The discovery of ferrocene brought about remarkable development of organometallic chemistry. ${ }^{14}$ Ferrocene has sandwich-type structure and is stable to air and to redox conditions.

Many people who work on fullerene chemistry must have thought that they can synthesize a dream molecule "bucky ferrocene" $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60}\right)$ (VIII), in which ferrocene is constructed on the fullerene sphere (Figure 4). ${ }^{15}$ However, nobody succeeded in the synthesis of "bucky ferrocene" $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60}\right)$ (VIII). The formation of a hybrid molecule $\operatorname{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60}\right)$ (VIII), which may be formed by direct combining of ferrocene and $\mathrm{C}_{60}$, are expected to be difficult by theoretical calculations. ${ }^{16}$ One of the reasons for its difficulty is that hybrid

[^3]molecule $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60}\right)$ (VIII) has open-shell structure; total electrons of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60}\right)(\mathrm{VIII})$ are odd number.

Figure 4. "Bucky ferrocene". Direct combination of ferrocene and fullerene.

If appropriate number of substituted groups could be introduced on the fullerene sphere, hybrid molecule of ferrocene and fullerene (bucky ferrocene) must be synthesizable because of its closed-shell structure. Our group already reported the quantitative and regioselective syntheses of pentaorgano fullerene derivatives $\mathrm{C}_{60} \mathrm{R}_{5} \mathrm{H}\left(\mathrm{R}=\mathrm{Me}, \mathrm{Ph}\right.$, etc.; Figure 5). ${ }^{17}$ These compounds have five substituted groups around one of the five-membered rings of $\mathrm{C}_{60}$, and a deprotonated compound can act as a cyclopentadienyl ligand. In these compounds, a transition metal can be introduced into only one position of $\mathrm{C}_{60}$.

Figure 5. Pentaorgano-fullerene derivatives. (a) Fullerene-cyclopentadiene. (b) Fullerene-cyclopentadienyl ligands.

I succeeded in the synthesis of the bucky ferrocenes by the use of a pentaorgano fullerene derivative $\mathrm{C}_{6} \mathrm{R}_{5}{ }^{17}$ as an $\eta^{5}$-cyclopentadienyl ligands. One of the reasons why bucky ferrocenes could be obtained is that I achieved an even number of the total electrons in bucky ferrocene molecules. I describe the synthesis, structure, stability, redox properties and chemical functionalizations of bucky ferrocenes. The study shows that the ferrocene core is stable and that the iron atom is electronically communicated with the fullerene core. These
results indicate that bucky ferrocenes could be used as functional molecules. I also mention the synthesis, structure and some properties of $\pi$-allyl nickel, palladium and platinum complexes as other examples of sandwich molecules. In particular, protection effect of the bulky $\mathrm{C}_{60} \mathrm{Ph}_{5}$ ligand was observed in these complexes.

## Chapter 2 Nickel, Palladium and Platinum Complexes

## of $\eta^{5}$-Cyclopentadienide $\mathrm{C}_{60} \mathrm{R}_{5}$ Ligands. Stabilization Effect of $\mathrm{C}_{60} \mathrm{Ph}_{5}$ Ligand

## 2-1. Introduction

Electronic structure of ligand is the major factor that controls the reactivity and stability of transition metal complexes: An illustrative example is the 18-electron sandwich complex of iron(II), ferrocene, where a pair of the $6 \pi$-electron cyclopentadienide endow extremely high stability of the complex. ${ }^{13}$ The sandwich structure may not be enough for the stability, since ferrocene's immediate neighbor, 20 -electron nickelocene, is relatively unstable and susceptible to oxidation by molecular oxygen. ${ }^{18}$ The 18-electron $\pi$-allylcyclopentadienyl nickel complex $\mathrm{Ni}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{Cp}\right)$ is even more unstable to oxygen and immediately decompose upon exposure to air. ${ }^{9,20}$ The physical structure of the ligand is another controlling factor. Suitably designed bulky ligands are known to stabilize coordinatively unsaturated metal complexes by

[^5]screening the approaches of extra ligand molecules. Isopropyl-substituted tris(pyrazolyl)borate is a recent member of such ligands. ${ }^{21}$

I and others in the Nakamura group previously reported the synthesis of a series of $\eta^{5}$-metal compounds that bear a $\mathrm{C}_{60} \mathrm{R}_{5}$ cyclopentadienyl ligand (denoted generically FCp ligands): ${ }^{17} \operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{R}_{5}\right)(\mathrm{CO})_{3},{ }^{22} \quad \mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{5}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right),{ }^{23}$ $\mathrm{Ru}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right) \mathrm{Ln}^{24,25}$ and $\left.\mathrm{Rh}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}\right)^{26}\left(\mathrm{C}_{60} \mathrm{Me}_{5}\right.$ is abbreviated as MeFCp). I have so far synthesized MeFCp complexes or, in a case, FCp ligands bearing hydrogen atoms instead of the methyl groups. Though the Nakamura group reported the synthesis of a $\mathrm{C}_{6} \mathrm{Ph}_{5}$ ligand ( PhFCp ) already in 1996 as the first report in the series, ${ }^{17 a}$ the group members have not been able to synthesize PhFCp transition metal complexes very likely because of steric congestion imposed by the five phenyl groups surrounding the cyclopentadienide moiety. This observation in turn suggested me that the PhFCp ligand may act to stabilize otherwise unstable transition metal complex by steric protection. In this chapter, I report the first synthesis of PhFCp transition metal complexes (as well as MeFCp complexes) for Group 10 triad, and show that the PhFCp ligand allows

[^6]the preparation of the first stable nickel $\pi$-allyl complex, which is stable against heat, water and molecular oxygen (at $80^{\circ} \mathrm{C}$ ). Palladium and platinum complexes, $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{R}_{5}\right)$ (allylic $=$ allyl, methallyl, crotyl; $\left.\mathrm{R}=\mathrm{Me}, \mathrm{Ph}\right)$ and $\operatorname{Pt}\left(\eta^{3}\right.$-methallyl $)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{R}_{5}\right)(\mathrm{R}=\mathrm{Me}, \mathrm{Ph})$, have also been synthesized. Palladium complexes were studied for their electrochemical properties.

## 2-2. Synthesis of the Nickel Complexes

The parent $\pi$-allyl nickel complex, $\mathrm{Ni}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{Cp}\right)$, is a sensitive compound; namely, it can be handled at ambient temperature, is stable to water, but immediately decomposes upon exposure to air. ${ }^{27}$ I first examined if I can synthesize the FCp analogues to see if the FCp ligand can stabilize the $\pi$-allyl nickel complex. Because of the electronegative fullerene core, the FCp cyclopentadienes (both MeFCp and PhFCp) are more acidic than water, ${ }^{28}$ and hence the corresponding cyclopentadienides are more electron-deficient than $\mathrm{C}_{5} \mathrm{H}_{5}$ anion. Between MeFCp and PhFCp, the latter is markedly congested

[^7]sterically (vide infra). I synthesized the $\pi$-allyl nickel complexes of MeFCp and PhFCp.

The standard metathesis method could be carried out reasonably well for the synthesis. The reactions of $\mathrm{K}\left(\eta^{5}-\mathrm{RFCp}\right)\left(\mathbf{1}^{17 \mathrm{c}}: \mathrm{R}=\mathrm{Me} ; \mathbf{2}^{17 \mathrm{a}}: \mathrm{R}=\mathrm{Ph}\right)$ with $[\mathrm{NiBr} \text { (allylic) }]_{2}$ (allylic $=$ allyl and methallyl) ${ }^{29}$ provided the desired fullerene-nickel complexes $\mathrm{Ni}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}\right.$-RFCp) $(3 \mathrm{~b}$ : allylic $=$ methallyl, $\mathrm{R}=$ $\mathrm{Me} ; \mathbf{4 a}:$ allylic $=$ allyl, $\mathrm{R}=\mathrm{Ph} ; \mathbf{4 b}$ : allylic $=$ methallyl, $\mathrm{R}=\mathrm{Ph})(\mathrm{eq} 1)$. After purification by preparative HPLC separation, fullerene-nickel complexes $\mathrm{Ni}\left(\eta^{3}\right.$-methallyl)( $\left.\eta^{5}-\mathrm{MeFCp}\right) \quad$ (3b), $\quad \mathrm{Ni}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{PhFCp}\right) \quad$ (4a) and $\mathrm{Ni}\left(\eta^{3}\right.$-methallyl $)\left(\eta^{5}-\mathrm{PhFCp}\right)(4 \mathbf{b})$ were obtained in 4.0 to $22 \%$ isolated yield. Attempted synthesis of $\mathrm{Ni}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{MeFCp}\right)$ resulted in exclusive formation of an allylated product $\mathrm{C}_{60} \mathrm{Me}_{5}\left(\mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right)(5 \mathbf{a})$ in $22 \%$ yield. In the synthesis of the PhFCp complex $\mathrm{Ni}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{PhFCp}\right)$ (4a), allyl compound $\mathrm{C}_{60} \mathrm{Ph}_{5}\left(\mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right)(6 a)$ was also obtained as a side product in $6 \%$ yield. The remainder of the material balance was largely the starting material $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{H}$ $(31 \%)$ or $\mathrm{C}_{60} \mathrm{Ph}_{5} \mathrm{H}(85 \%)$ and its oxidation products $(\mathrm{R}=\mathrm{Me}: 60 \% ; \mathrm{R}=\mathrm{Ph}: 5 \%)$ that were formed during workup. Since nickel complex $\mathrm{Ni}\left(\eta^{3}-\right.$ allyl $)\left(\eta^{5}-\mathrm{PhFCp}\right)$ (4a) does not decompose to give the allyl compound $\mathrm{C}_{60} \mathrm{Ph}_{5}\left(\mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right)(\mathbf{6 a})$ under the reaction condition, allyl compound $\mathrm{C}_{60} \mathrm{Ph}_{5}\left(\mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right)$ (6a) must

[^8]be formed some how independently of the pathway leading the $\pi$-allyl complex.

| $\begin{gathered} \text { 3b: } 8.1 \% \\ \left(R=M e, R^{1}=M e, R^{2}=H\right)\left(R=M e, R^{1}=M e, R^{2}=H\right) \end{gathered} \begin{gathered} 31 \% \\ (R=M e) \end{gathered}$ | $\begin{gathered} 60 \% \\ (\mathrm{R}=\mathrm{Me}) \end{gathered}$ |

$$
{ }^{a_{N D}}=\text { no data }
$$

Structure assignment was achieved by the standard physical methods. High resolution APCI-TOF-MS (+) data were consistent with the assigned structures. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR measurements of nickel complexes $\mathrm{Ni}\left(\eta^{3}\right.$-methallyl $)\left(\eta^{5}\right.$-MeFCp) (3b), $\quad \mathrm{Ni}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{PhFCp}\right) \quad$ (4a) and $\mathrm{Ni}\left(\eta^{3}\right.$-methallyl $)\left(\eta^{5}-\mathrm{PhFCp}\right)(4 \mathbf{b})$ indicated that the FCp moieties have $C_{5 v}$
symmetry. These results show that the rotation rates of the FCp moieties around the Ni-FCp axis are faster than the relaxation time of NMR spectra.

All FCp nickel complexes $\operatorname{Ni}\left(\eta^{3}\right.$-methallyl) $\left(\eta^{5}-\mathrm{MeFCp}\right)$ $\mathrm{Ni}\left(\eta^{3}\right.$-allyl) $\left(\eta^{5}-\mathrm{PhFCp}\right)(4 \mathbf{a})$ and $\mathrm{Ni}\left(\eta^{3}\right.$-methallyl $)\left(\eta^{5}-\mathrm{PhFCp}\right)(4 \mathbf{b})$ were found to be far stable than the parent $\pi$-allyl complex, which decomposes in 1 min upon exposure to air. Thus, the methallyl MeFCp complex $\mathrm{Ni}\left(\eta^{3}\right.$-methallyl) $\left(\eta^{5}-\mathrm{MeFCp}\right)(3 \mathrm{~b})$ in toluene decompose very slowly in air at $25^{\circ} \mathrm{C}$, leaving $30 \%$ of the material even after 5 days. The $\pi$-allyl PhFCp complex $\mathrm{Ni}\left(\eta^{3}\right.$-allyl) $\left(\eta^{5}-\mathrm{PhFCp}\right)$ (4a) is extremely stable: In toluene exposed to air at $80^{\circ} \mathrm{C}$, it was completely recovered after 15 h , and the $\pi$-methallyl PhFCp complex $\mathrm{Ni}\left(\eta^{3}\right.$-methallyl) $\left(\eta^{5}-\mathrm{PhFCp}\right)$ (4b) in toluene was also recovered completely after 15 h at $80^{\circ} \mathrm{C}$.

## 2-3. Synthesis of the Palladium and Platinum Complexes

On the basis of the method to synthesize fullerene-nickel complexes, I synthesized fullerene-palladium and platinum complexes. Palladium and platinum complexes, $\operatorname{Pd}\left(\eta^{3}\right.$-allylic) $\left(\eta^{5}\right.$-RFCp) $(7 \mathrm{a}:$ allylic $=$ allyl, $\mathrm{R}=\mathrm{Me} ; 7 \mathrm{~b}$ : allylic $=$ methallyl, $\mathrm{R}=\mathrm{Me} ; 7 \mathrm{c}:$ allylic $=$ crotyl, $\mathrm{R}=\mathrm{Me} ; 8 \mathrm{a}:$ allylic $=$ allyl, $\mathrm{R}=\mathrm{Ph}$; 8b: allylic $=$ methallyl, $\mathrm{R}=\mathrm{Ph} ; 8 \mathbf{c}:$ allylic $=$ crotyl, $\mathrm{R}=\mathrm{Ph}$ ) and $\operatorname{Pt}\left(\eta^{3}\right.$-methallyl) $\left(\eta^{5}-\mathrm{RFCp}\right)(9: \mathrm{R}=\mathrm{Me} ; 10: \mathrm{R}=\mathrm{Ph})$, could be synthesized by transmetalation of a potassium salt $\mathrm{K}\left(\eta^{5}-\mathrm{MeFCp}\right)$ (1) or $\mathrm{K}\left(\eta^{5}-\mathrm{PhFCp}\right)$ (2) with
$\left[\operatorname{PdCl}\left(\eta^{3} \text {-allylic }\right)\right]_{2} \quad$ (allylic $=$ allyl, methallyl and crotyl) 30 or $\left[\operatorname{PtCl}\left(\eta^{3} \text {-methallyl) }\right]_{2}^{31}\right.$ (eqs 2 and 3). The reaction affording the palladium complexes $\operatorname{Pd}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{MeFCp}\right) \quad$ (7a), $\quad \operatorname{Pd}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{PhFCp}\right) \quad$ (8a) and platinum complex $\operatorname{Pt}\left(\eta^{3}-\right.$ methallyl $)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (9) also gave allylated and methallylated side products, $\mathrm{C}_{60} \mathrm{Me}_{5}\left(\mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right)(5 a), \mathrm{C}_{60} \mathrm{Ph}_{5}\left(\mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right)$ (6a) and $\mathrm{C}_{60} \mathrm{Me}_{5}\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{Me})=\mathrm{CH}_{2}\right)(5 \mathbf{b})$ in 8 to $10 \%$ yield. Palladium complexes $\operatorname{Pd}\left(\eta^{3}\right.$-allyl) $\left(\eta^{5}-\mathrm{MeFCp}\right)(7 \mathbf{a}), \operatorname{Pd}\left(\eta^{3}-\right.$ allyl $)\left(\eta^{5}-\mathrm{PhFCp}\right)(8 \mathbf{a})$ and platinum complex $\operatorname{Pt}\left(\eta^{3}\right.$-methallyl $)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (9) do not decompose into allylic compounds $\mathrm{C}_{60} \mathrm{Me}_{5}\left(\mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right) \quad$ (5a), $\quad \mathrm{C}_{60} \mathrm{Ph}_{5}\left(\mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right) \quad$ (6a) and $\mathrm{C}_{60} \mathrm{Me}_{5}\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{Me})=\mathrm{CH}_{2}\right)(\mathbf{5 b})$ in the reaction conditions, indicating that allylic compounds $\mathrm{C}_{60} \mathrm{Me}_{5}\left(\mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right) \quad$ (5a), $\quad \mathrm{C}_{60} \mathrm{Ph}_{5}\left(\mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right) \quad$ (6a) and $\mathrm{C}_{60} \mathrm{Me}_{5}\left(\mathrm{CH}_{2} \mathrm{C}(\mathrm{Me})=\mathrm{CH}_{2}\right)(\mathbf{5 b})$ must be formed by the nucleophilic attack of anions MeFCp - or PhFCp - to the allylic palladium or platinum species, not by the reductive elimination of palladium or platinum complexes $\operatorname{Pd}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{MeFCp}\right)(7 \mathbf{a}), \operatorname{Pd}\left(\eta^{3}-\right.$ allyl $)\left(\eta^{5}-\mathrm{PhFCp}\right)(8 \mathbf{a})$ and platinum complex $\operatorname{Pt}\left(\eta^{3}\right.$-methallyl)( $\left.\eta^{5}-\mathrm{MeFCp}\right)$ (9). After purification by preparative HPLC separation, fullerene-palladium and platinum complexes $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{RFCp}\right)(7 \mathbf{a}:$ allylic $=$ allyl, $\mathrm{R}=\mathrm{Me} ; 7 \mathbf{b}$ : allylic $=$ methallyl, $\mathrm{R}=$ Me; 7c: allylic = crotyl, $\mathrm{R}=\mathrm{Me} ; \mathbf{8 a}$ : allylic = allyl $\mathrm{R}=\mathrm{Ph} ; \mathbf{8 b}$ : allylic = methallyl,

[^9]$\mathrm{R}=\mathrm{Ph} ; 8 \mathrm{c}:$ allylic $=$ crotyl, $\mathrm{R}=\mathrm{Ph})$ and $\operatorname{Pt}\left(\eta^{3}-\right.$ methallyl $)\left(\eta^{5}-\mathrm{RFCp}\right)(9: \mathrm{R}=\mathrm{Me} ; \mathbf{1 0}$ : $\mathrm{R}=\mathrm{Ph}$ ) were obtained in 21 to $71 \%$ (palladium complexes) or 6.5 to $14 \%$ (platinum complexes) isolated yield.

(3)

Identification of these palladium and platinum complexes, $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{RFCp}\right)(7 \mathbf{a}:$ allylic $=$ allyl, $\mathrm{R}=\mathrm{Me} ; 7 \mathbf{b}:$ allylic $=$ methallyl, $\mathrm{R}=$ Me; 7c: allylic = crotyl, $\mathrm{R}=\mathrm{Me} ; 8 \mathrm{a}:$ allylic = allyl, $\mathrm{R}=\mathrm{Ph} ; \mathbf{8 b}$ : allylic = methallyl, $\mathrm{R}=\mathrm{Ph} ; 8 \mathrm{c}:$ allylic $=$ crotyl, $\mathrm{R}=\mathrm{Ph})$ and $\operatorname{Pt}\left(\eta^{3}\right.$-methallyl $)\left(\eta^{5}-\mathrm{RFCp}\right)(\mathbf{9}: \mathrm{R}=\mathrm{Me} ; \mathbf{1 0}:$ $\mathrm{R}=\mathrm{Ph}$ ) were achieved by the high-resolution APCI-TOF-MS (+) and the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR measurements. In the ${ }^{1} \mathrm{H}$ NMR spectra of the platinum complexes $\operatorname{Pt}\left(\eta^{3}\right.$-methallyl) $\left(\eta^{5}-\mathrm{MeFCp}\right) \quad$ (9) and $\quad \operatorname{Pt}\left(\eta^{3}\right.$-methallyl $)\left(\eta^{5}-\mathrm{PhFCp}\right) \quad$ (10), platinum-hydrogen spin-spin couplings $\left[\operatorname{Pt}\left(\eta^{3}\right.\right.$-methallyl $)\left(\eta^{5}-\mathrm{MeFCp}\right)(9): J=$ 27.2, 111.6, $63.6 \mathrm{~Hz} ; \operatorname{Pt}\left(\eta^{3}\right.$-methallyl $\left.)\left(\eta^{5}-\mathrm{PhFCp}\right)(10): J=32.1,117.8,64.6 \mathrm{~Hz}\right]$ were observed. These coupling constants in platinum complexes $\operatorname{Pt}\left(\eta^{3}-\right.$ methallyl $)\left(\eta^{5}-\mathrm{MeFCp}\right)(9)$ and $\operatorname{Pt}\left(\eta^{3}-\right.$ methallyl $)\left(\eta^{5}-\mathrm{PhFCp}\right)(10)$ are in good
agreement with those in $\operatorname{Pt}\left(\eta^{3}\right.$-methallyl $)\left(\eta^{5}-\mathrm{Cp}\right)^{32}(J=34,111,61 \mathrm{~Hz})$. The allylic protons in the $\mathrm{Pd}-\mathrm{PhFCp}$ complexes $\mathrm{Pd}\left(\eta^{3}\right.$-allylic) $\left(\eta^{5}-\mathrm{PhFCp}\right)$ (8a: allylic = allyl; 8b: allylic = methallyl; 8c: allylic = crotyl) were observed at higher magnetic field ( $\delta 2.09,3.08$, and 4.70 ppm ) than those of the $\mathrm{Pd}^{-} \mathrm{C}_{5} \mathrm{Ph}_{5}$ ones $(\delta$ $2.66,3.65$, and 5.30 ppm ) (Table 1). ${ }^{30 \mathrm{~d}}$ The reason for this observation is that five phenyl groups of the $\mathrm{Pd}-\mathrm{PhFCp}$ complexes $\mathrm{Pd}\left(\eta^{3}\right.$-allylic) $\left(\eta^{5}-\mathrm{PhFCp}\right)$ (8a: allylic $=$ allyl; 8b: allylic $=$ methallyl; $8 \mathbf{c}$ : allylic $=$ crotyl ) surround $\pi$-allylic palladium moieties and the protons of allylic moieties receive therefore the shielding effects of five phenyl groups in $\operatorname{Pd}\left(\eta^{3}\right.$-allylic) $\left(\eta^{5}-\mathrm{PhFCp}\right)$ (8a: allylic $=$ allyl; $\mathbf{8} \mathbf{b}$ : allylic $=$ methallyl; $\mathbf{8 c}:$ allylic $=$ crotyl $)$. Note that proton signals of $\pi$-allyl moiety of the $\mathrm{C}_{5} \mathrm{Me}_{5}$ palladium complex $\mathrm{Pd}\left(\eta^{3}\right.$-allyl) $\left(\eta^{5}-\mathrm{C}_{5} \mathrm{Me}_{5}\right)^{30 \mathrm{c}}$ are observed at higher magnetic fields (1.91, 2.96, and 4.75 ppm ) than those of the $\mathrm{C}_{5} \mathrm{Ph}_{5}$ palladium complex $\operatorname{Pd}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{C}_{5} \mathrm{Ph}_{5}\right)^{30 \mathrm{~d}}$ (Table 1). The differences between the chemical shift values of $\mathrm{C}_{5} \mathrm{Me}_{5}$ and $\mathrm{C}_{5} \mathrm{Ph}_{5}$ complexes are due to the electron donating or withdrawing nature of $\mathrm{C}_{5} \mathrm{Me}_{5}$ or $\mathrm{C}_{5} \mathrm{Ph}_{5}$ ligands. If the same effect persists in the fullerene palladium complexes, proton signals of $\pi$-allyl moiety of the methylated fullerene-palladium complexes $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (7a: allylic $=$ allyl; 7b: allylic $=$ methallyl; 7c: allylic $=$ crotyl $)$ must be observed at higher magnetic fields than those of the phenylated fullerene-palladium complexes $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{PhFCp}\right)(8 \mathbf{a}:$ allylic $=$ allyl; $\mathbf{8 b}$ : allylic $=$ methallyl; $8 \mathbf{c}:$ allylic $=$ crotyl $).$ However, the fact is exactly the opposite (Table 1). Namely, in

[^10]the ${ }^{1} \mathrm{H}$ NMR spectra, proton signals of $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{PhFCp}\right)(8 \mathbf{a}:$ allylic $=$ allyl; 8b: allylic = methallyl; 8c: allylic = crotyl) were observed at higher magnetic field than those of $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{MeFCp}\right)(7 \mathbf{a}:$ allylic $=$ allyl; $7 \mathbf{b}$ : allylic $=$ methallyl; 7c: allylic $=$ crotyl) in spite of the electron withdrawing nature of the PhFCp ligand that is stronger than that of the MeFCp one. These results indicated that the shielding effects of five phenyl groups of the PhFCp moiety to allylic protons are larger than the effect of electron donating or withdrawing nature of the RFCp ligands. These shielding effects must be due to the structure of the PhFCp ligand that will be discussed in the next, X-ray analysis section.

Table 1. Comparison of ${ }^{1} \mathrm{H}$ NMR Chemical Shifts (ppm) between $\pi$-Allylic Ligands of Palladium Complexes 7a-c and 8a-c

## 2-4. X-ray Crystal Structure Analysis

Dark red single crystals of palladium complexes $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{RFCp}\right)(7 \mathbf{a}$ : allylic $=$ allyl, $R=\mathrm{Me} ; 7 \mathrm{~b}$ : allylic $=$ methallyl, $\mathrm{R}=\mathrm{Me} ; 7 \mathrm{c}:$ allylic $=\operatorname{crotyl}, \mathrm{R}=\mathrm{Me}$; 8a: allylic $=$ allyl, $\mathrm{R}=\mathrm{Ph} ; \mathbf{8 b}$ : allylic $=$ methallyl, $\mathrm{R}=\mathrm{Ph} ; 8 \mathbf{c}$ : allylic $=$ crotyl, $\mathrm{R}=$ Ph ) could be obtained by recrystallization from $\mathrm{CS}_{2} / \mathrm{EtOH}$. X-ray crystal structure analyses of these complexes were performed (Figures 6 and 7). The FCp ligands coordinate to the palladium atom in an $\eta^{5}$-fashion. The FCp and the $\pi$-allylic moieties form sandwich-type structure. Hydrogen atoms on the $\pi$-allylic ligands in palladium complexes $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{PhFCp}\right)(8 \mathbf{a}$ : allylic $=$ allyl; 8b: allylic $=$ methallyl; 8c: allylic $=$ crotyl) are located in the space surrounded by five phenyl groups. These results correspond to the fact that allylic protons of palladium complexes $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{PhFCp}\right)(8 \mathrm{a}:$ allylic $=$ allyl; $\mathbf{8 b}$ : allylic $=$ methallyl; $\mathbf{8 c}$ : allylic $=$ crotyl $)$ are subjected to the shielding effect of the phenyl groups. The average bond lengths of the five Pd-C(FCp) bonds of fullerene-palladium complexes $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{MeFCp}\right)(7 \mathrm{a}:$ allylic $=$ allyl; 7b: allylic $=$ methallyl $)(2.34$ and $2.36 \AA)$ and $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{PhFCp}\right)(8 \mathbf{a}:$ allylic $=$ allyl; $8 \mathbf{b}:$ allylic $=$ methallyl; $\mathbf{8 c}:$ allylic $=\operatorname{crotyl})(2.37,2.37$ and $2.40 \AA)$ are slightly longer than that of $\operatorname{Pd}\left(\eta^{3}-\right.$ allyl $)\left(\eta^{5}-\mathrm{Cp}\right)^{33}(2.26 \AA)$ (Table 2). The bond lengths between palladium atom and three carbon atoms on $\pi$-allylic moieties of fullerene-palladium complexes $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (7a: allylic $=$ allyl; 7b: allylic $=$ methallyl) (7a: 2.15, 2.09, $2.18 \AA$; 7b: 2.13, 2.11, $2.13 \AA$ ) and

[^11]$\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{PhFCp}\right)(8 \mathbf{a}:$ allylic $=$ allyl; $\mathbf{8 b}$ : allylic $=$ methallyl; $8 \mathbf{c}$ : allylic $=$ crotyl) (8a: 2.13, 2.08, $2.15 \AA$; 8b: 2.13, 2.13, $2.14 \AA$; 8c: 2.18, $2.10,2.16 \AA$ ) are also slightly longer than those of $\operatorname{Pd}\left(\eta^{3}-\right.$ allyl $)\left(\eta^{5}-\mathrm{Cp}\right)^{33}(2.10,2.04,2.07 \AA$ ) (Table 2). These bond lengths of pentaphenylated fullerene complexes $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{PhFCp}\right)$ (8a: allylic $=$ allyl; 8b: allylic $=$ methallyl $)$ and pentamethylated fullerene complexes $\operatorname{Pd}\left(\eta^{3}\right.$-allylic) $\left(\eta^{5}-\mathrm{MeFCp}\right)$ (7a: allylic $=$ allyl; $7 \mathbf{b}$ : allylic $=$ methallyl) are almost the same within the standard deviation. This observation indicates that there is no steric hindrance between the allylic moieties and the five methyl or the phenyl groups of the RFCp ligands. In fact, the closest $\mathrm{C}-\mathrm{H}$ and $\mathrm{H}-\mathrm{H}$ bond lengths among the $\mathrm{Pd}-\mathrm{PhFCp}$ complexes are 2.89-3.28 $\AA$ [between carbon atoms of the five phenyl groups and hydrogen atoms of the methallyl ligand, in $\operatorname{Pd}\left(\eta^{3}\right.$-methallyl) $\left.\left(\eta^{5}-\mathrm{PhFCp}\right)(8 \mathrm{~b})\right]$ and 2.43-3.04 $\AA$ [between hydrogen atoms of the five phenyl groups and those of the methallyl ligand, in $\operatorname{Pd}\left(\eta^{3}\right.$-methallyl) $\left.\left(\eta^{5}-\mathrm{PhFCp}\right)(8 \mathbf{b})\right]$, respectively, the values of which are longer than known van der Waals contacts $(\mathrm{H}-\mathrm{C}=2.90 \AA ; \mathrm{H}-\mathrm{H}=$ $2.40 \AA$ A․ ${ }^{34}$

[^12]Table 2. Selected Bond Lengths ( $\AA$ ) of Fullerene-Palladium Complexes 7a-b and 8a-c

## 2-5. Electrochemical Investigations

I and the Nakamura group members already reported the electrochemical investigations of fullerene transition metal complexes $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right),{ }^{23}$ $\mathrm{Ru}\left(\eta^{5}-\mathrm{MeFCp}\right)\left(\mathrm{CH}_{3}\right)(\mathrm{CO})_{2}{ }^{24}$ and $\mathrm{Rh}\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2}{ }^{26}$ In these complexes, metal-fullerene bonds are stable under oxidation and reduction conditions. I here examined the redox behavior of $\pi$-allyl palladium complexes $\operatorname{Pd}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{MeFCp}\right)(7 \mathbf{a})$ and $\operatorname{Pd}\left(\eta^{3}\right.$-allyl)( $\left.\eta^{5}-\mathrm{PhFCp}\right)(8 \mathbf{a})$ (Figure 8, Table 3). A scan from 0.82 to -2.87 V (scan rate: $100 \mathrm{mV} / \mathrm{s}$ ) revealed that the palladium complexes $\operatorname{Pd}\left(\eta^{3}-\operatorname{allyl}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (7a) and $\operatorname{Pd}\left(\eta^{3}\right.$-allyl) $\left(\eta^{5}-\mathrm{PhFCp}\right)$ (8a) were not oxidized but were reduced irreversibly, likewise palladium $\eta^{2}$-fullerene complexes (Figure 8a,c). ${ }^{35}$ Pentamethylated fullerene-palladium complex $\operatorname{Pd}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{MeFCp}\right)(7 \mathbf{a})$ is stable in first one electron reduction, but unstable in second one electron reduction (Figure 8a,b; Scheme 1). In the case of pentaphenylated fullerene-palladium complex $\operatorname{Pd}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{MeFCp}\right)(8 \mathbf{a})$, decomposition of the complex is observed in one electron reduction step (Figure 8c,d; Scheme 2). The reduction potentials of $\operatorname{Pd}\left(\eta^{3}-\right.$ allyl $)\left(\eta^{5}-\mathrm{MeFCp}\right)(7 \mathbf{a})$ and $\operatorname{Pd}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{PhFCp}\right) \quad$ (8a) are comparable to those of

[^13]$\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right),{ }^{23} \mathrm{Ru}\left(\eta^{5}-\mathrm{MeFCp}\right)\left(\mathrm{CH}_{3}\right)(\mathrm{CO})_{2,}{ }^{24} \mathrm{Rh}\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2}{ }^{26}$ and $\mathrm{C}_{60} \mathrm{Ph}_{5} \mathrm{H} .{ }^{36}$ Reversible and irreversible reductions of $\mathrm{Pd}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (7a) and $\operatorname{Pd}\left(\eta^{3}\right.$-allyl) $\left(\eta^{5}-\mathrm{PhFCp}\right)$ (8a) could be considered to occur in the fullerene moieties. The difference of the reduction potentials between $\operatorname{Pd}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{MeFCp}\right)(7 \mathbf{a})(-1.47 \mathrm{~V})$ and $\operatorname{Pd}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{PhFCp}\right)(8 \mathbf{a})(-1.40 \mathrm{~V})$ likely arises from the fact that reduction of the PhFCp ligand is much easier than that of the MeFCp ligand.

[^14]

Figure 8. Cyclic voltammograms of $\operatorname{Pd}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{MeFCp}\right)(7 \mathbf{a})(\mathrm{a}$ and b$)$ and $\operatorname{Pd}\left(\eta^{3}\right.$-allyl) $\left(\eta^{5}-\mathrm{PhFCp}\right)(8 \mathrm{a})$ (c and d) $\left(0.10 \mathrm{M}\left[\mathrm{Bu}_{4} \mathrm{~N}\right]\left[\mathrm{ClO}_{4}\right]\right.$ in THF, 1.0 mM , glassy carbon working electrode, $0.10 \mathrm{~V} / \mathrm{s}, 25^{\circ} \mathrm{C}$ ).

\end{aligned}
$$

In the course of the two electron reductions, anion $\mathbf{A}^{-}$, anion $\mathbf{B}^{-}$(in Figure $8 \mathrm{a}, \mathrm{c}$, and Schemes 1 and 2) and those redox products were formed together with reduced palladium complexes, $\mathbf{7 a} \mathbf{a}^{-}, 7 \mathbf{a}^{2-}, \mathbf{8 a}$, and $\mathbf{8} \mathbf{a}^{2-}$. In view of the Nakamura group member's previous result, ${ }^{36}$ these anions $\mathbf{A}^{-}$and $\mathbf{B}^{-}$can be assigned to the anions MeFCp- and PhFCp- This result shows that Pd-MeFCp and Pd-PhFCp bonds were cleaved by the reductions. One of the explanations why Pd-MeFCp and $\mathrm{Pd}-\mathrm{PhFCp}$ bonds were cleaved by the reductions is that $\mathrm{Pd}^{0}$ (palladium metal) formed, followed by the reduction of the fullerene part of
$\operatorname{Pd}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (7a) and $\operatorname{Pd}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{PhFCp}\right)$ (8a). This strongly indicates that there are electronic interactions between the palladium atom and the RFCp ligands like bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)^{23}$ and the other transition metal-FCp complexes. ${ }^{24,25,26}$

## 2-6. Stabilization Effect of the FCp Ligand

Present nickel-FCp-allyl complexes $\mathrm{Ni}\left(\eta^{3}\right.$-methallyl)( $\left.\eta^{5}-\mathrm{MeFCp}\right)(3 \mathrm{~b})$, $\mathrm{Ni}\left(\eta^{3}\right.$-allyl) $\left(\eta^{5}-\mathrm{PhFCp}\right)$ (4a) and $\mathrm{Ni}\left(\eta^{3}\right.$-methallyl) $\left(\eta^{5}-\mathrm{PhFCp}\right)(\mathbf{4 b})$ are stable upon exposure to air even at high temperature, while the parent nickel-Cp-allyl complexes decompose by molecular oxygen. I thought about two reasons for the stability of $\mathrm{Ni}\left(\eta^{3}-\right.$ methallyl $)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{3 b}), \mathrm{Ni}\left(\eta^{3}-\right.$-allyl $)\left(\eta^{5}-\mathrm{PhFCp}\right)(4 \mathbf{a})$ and $\mathrm{Ni}\left(\eta^{3}-\right.$ methallyl $)\left(\eta^{5}-\mathrm{PhFCp}\right)(4 \mathbf{b})$. One is an electronic reason; since the electron density of nickel atoms is reduced by the electron withdrawing nature of fullerene moieties, the compounds $\mathrm{Ni}\left(\eta^{3}\right.$-methallyl) $\left(\eta^{5}-\mathrm{MeFCp}\right) \quad(3 b)$, $\mathrm{Ni}\left(\eta^{3}\right.$-allyl) $\left(\eta^{5}-\mathrm{PhFCp}\right)$ (4a) and $\mathrm{Ni}\left(\eta^{3}\right.$-methallyl) $\left(\eta^{5}-\mathrm{PhFCp}\right)$ (4b) become difficult to oxidize by air. The other reason is that $\mathrm{O}_{2}$ molecules might not approach to the nickel atoms because of the sterically hindering five methyl or phenyl groups on the fullerene moiety. Compared with the MeFCp ligand, PhFCp ligand can stabilize nickel complexes more effectively. This result consistent both with the degree of electron withdrawing nature and with the protection effect of the RFCp ligands. Although I can not conclusively determined whether electron withdrawing nature of the ligands or steric
protection reason contribute much more effectively to stabilization of reactive metal center, the FCp ligands, in particular the PhFCp ligand, obviously bring both thermodynamic and kinetic stability of the compounds.

From the point of view of stabilizing effect concerning with the shape of the molecule, I can clearly imagine sterically hindered hydrotris(pyrazolyl)borate (Tp) ligand. ${ }^{21,37,38,39}$ The Tp ligands are the six electron donor ones with -I valent and the isoelectronic with cyclopentadienide ones. Thus, many kinds of metal complexes with the Tp ligands have been synthesized. ${ }^{21}$ It is well known that the Tp ligands containing sterically bulky substituent can protect metal centers and stabilize kinetically unstable intermediates. ${ }^{40,41}$ For example, copper carbonyl complex $\mathrm{HB}\left(3,5-\mathrm{Me}_{2} \mathrm{pz}\right)_{3} \mathrm{CuCO}^{42}$ is much more stable than $\mathrm{HB}(\mathrm{pz})_{3} \mathrm{CuCO} .{ }^{40,42}$ The stabilization effect was also observed in the fullerene complexes. Thus present FCp ligand may be used extensively as ancillary ligands by changing of substituents of the fullerene ligands.

[^15]
## 2-7. Conclusion

In the present study, I have succeeded in the first synthesis and characterizations of pentamethylated and pentaphenylated fullerene-nickel, palladium and platinum complexes. These complexes represent the second sandwich-type complexes bearing the pentasubstituted fullerene ligands ever synthesized. In the nickel complexes, the stabilization effect of the RFCp ( $\mathrm{R}=$ $\mathrm{Me}, \mathrm{Ph})$ ligands to air was observed because of the electron withdrawing nature or steric protection effect of the RFCp moieties. The PhFCp ligand can stabilize nickel complexes much more effectively than the MeFCp ligand, since five phenyl groups surround nickel atom and allylic ligand. In view of the wide field of the Cp and Tp ligands, I thus anticipate that the steric protection effect of FCp ligand plays a unique role in development of new materials and isolation of important unstable compounds.

## 2-8. Experimental

General Procedure. All manipulations were carried out under nitrogen or argon atmosphere using standard Schlenk techniques. THF was distilled from $\mathrm{Na} / \mathrm{K}$ alloy and thoroughly degassed by trap-to-trap distillation. $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{H}$ and $\mathrm{C}_{60} \mathrm{Ph}_{5} \mathrm{H}$ were prepared according to the literature. ${ }^{17} \mathrm{THF}$ solution of $t$-BuOK was purchased from Sigma-Aldrich Co. and used as received. Complexes $\left[\mathrm{NiBr}\left(\eta^{3} \text {-allyl }\right)\right]_{2},^{29 \mathrm{a}} \quad\left[\mathrm{NiBr}\left(\eta^{3} \text {-methallyl }\right)\right]_{2,}{ }^{29 \mathrm{~b}} \quad\left[\mathrm{PdCl}\left(\eta^{3} \text {-allyl }\right)\right]_{2},{ }^{30}$ $\left[\operatorname{PdCl}\left(\eta^{3}-\text { methallyl }\right)\right]_{2},{ }^{30}\left[\operatorname{PdCl}\left(\eta^{3}-\operatorname{crotyl}\right)\right] 2^{30}$ and $\left[\mathrm{PtCl}\left(\eta^{3}-\text { methallyl }\right)\right]_{2}^{31}$ were
prepared as reported in the literature. Preparative HPLC separations were performed by use of Bucky Prep. column (Nakalai Tesque Co., $20 \mathrm{~mm} \times 250$ $\mathrm{mm})$. The ${ }^{1} \mathrm{H}(400 \mathrm{MHz})$ and ${ }^{13} \mathrm{C}(100 \mathrm{MHz})$ NMR spectra were recorded using JEOL EX-400 spectrometer. Proton chemical shift are reported relative to $\mathrm{Me}_{4} \mathrm{Si}$ $\left(\mathrm{CDCl}_{3}\right)$ at $\delta 0.00 \mathrm{ppm}$ or residual solvent peaks $\left(\mathrm{CDCl}_{3}\right.$ at $\delta 7.26 \mathrm{ppm}$; THF- $d_{8}$ at $\delta 1.73$ and 3.58 ppm$)$. Carbon chemical shifts are reported relative to $\mathrm{CDCl}_{3}$ at $\delta$ 77.00 ppm or THF- $d_{8}$ at $\delta 25.20$ and 67.40 ppm . Other spectra were recorded on the following instruments: IR, JASCO IR-420 and ReactIR 1000; UV/vis spectra, HITACHI U3500 and Shimadzu SPD-6A; Mass spectra, Shimadzu LCMS-QP8000, JEOL Accu TOF (JMS-T100LC) and JEOL GCMS (JMS-GCMATE II). Elemental Analyses were performed at organic elemental analysis laboratory in this department.
$\mathbf{N i}\left(\boldsymbol{\eta}^{\mathbf{3}}\right.$-methallyl)( $\boldsymbol{\eta}^{\mathbf{5}}$-MeFCp) (3b). To a suspension of $\mathrm{MeFCpH}(50.0 \mathrm{mg}$, $62.7 \mu \mathrm{~mol})$ in THF ( 5.0 mL ) was added a solution of ${ }^{t} \mathrm{BuOK}(1.0 \mathrm{M}, 69.0 \mu \mathrm{~L}, 69.0$ $\mu \mathrm{mol}$ ) in THF. To the resulting dark reddish orange solution, $\left[\mathrm{NiBr}\left(\eta^{3}-\text { methallyl }\right)\right]_{2}(13.4 \mathrm{mg}, 34.5 \mu \mathrm{~mol})$ was added. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 10 min before quenched by addition of saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}(1.0 \mathrm{~mL})$. The mixture was diluted with toluene and washed with water. The organic layer was dried with $\mathrm{MgSO}_{4}$, and was concentrated under reduced pressure. Preparative HPLC separations [Bucky Prep. (Nacalai Tesque Co., 20 $\mathrm{mm} \times 250 \mathrm{~mm})$ ] afforded $\mathrm{Ni}\left(\eta^{3}-\right.$ methallyl $)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{3 b})(4.0 \mathrm{mg}, 7.0 \%$ yield $)$
as dark red fine crystals. $\mathrm{Ni}\left(\eta^{3}-\right.$ methallyl $)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{3 b}):{ }^{1} \mathrm{H}$ NMR (400 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta 2.29(\mathrm{~s}, 3 \mathrm{H}), 2.30(\mathrm{~s}, 15 \mathrm{H}), 2.54(\mathrm{~s}, 2 \mathrm{H}), 3.61(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 29.79$ (1C), 30.08 (5C), 44.20 (2C), 51.01 (5C), 100.51 (1C), 111.88 (5C), 143.30 (10C), 145.05 (10C), 146.39 (5C), 147.55 (10C), 148.29 (5C), 154.19 (10C); IR (powder, $\mathrm{cm}^{-1}$ ) v 2959 (m), 2918 (m), 2854 (m), 1723 (m), 1441 (s), 1368 (m), 1286 (m), 1264 (m), 1236 (w), 1213 (w), 1200 (w), 1156 (w), 1115 (w), 1071 (w), 1018 (w), 902 (m), 802 (m), 752 (s), 728 (s), 685 (s), 666 (m), 658 (m); UV-vis (toluene/2-propanol $=7 / 3$ ) $\lambda_{\max } 286,348$ (shoulder), 395, 480 (shoulder); HR-APCI-MS (-) $m / z$; found: 908.1081; calcd for 3b: 908.1075.
$\mathrm{Ni}\left(\boldsymbol{\eta}^{3}\right.$-allyl $)\left(\boldsymbol{\eta}^{5}\right.$-PhFCp) (4a). X-ray Diffraction Study. Crystals of $\operatorname{Pd}\left(\eta^{3}\right.$-allylic) $\left(\eta^{5}-\mathrm{MeFCp}\right)(7 \mathrm{a}:$ allylic $=$ allyl; $7 \mathbf{b}:$ allylic $=$ methallyl $)$ and $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{PhFCp}\right)(8 \mathbf{a}:$ allylic $=$ allyl; $\mathbf{8 b}:$ allylic $=$ methallyl; 8c: allylic $=$ crotyl) suitable for the X-ray diffraction study were mounted on a MacScience DIP2030 Imaging Plate diffractometer for data collection using $\mathrm{MoK} \alpha$ (graphite monochromated, $\lambda=0.71069 \AA$ ) radiation. Crystal data and data statistics are summarized in Table 4. The structure of the complex $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{MeFCp}\right)(7 \mathbf{a}:$ allylic $=$ allyl; $7 \mathbf{b}$ : allylic $=$ methallyl $)$ and $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{PhFCp}\right)(8 \mathbf{a}:$ allylic $=$ allyl; $\mathbf{8 b}:$ allylic $=$ methallyl; $\mathbf{8 \mathbf { c }}:$ allylic $=$ crotyl) were solved by the directed method (SHELXS-97) ${ }^{43}$ and expanded using Fourier techniques (DIRDIF-94). ${ }^{44}$ The positional parameter and thermal parameters of non-hydrogen atoms of $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (7a: allylic $=$ allyl; 7b: allylic $=$ methallyl $)$ and $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{PhFCp}\right)(8 \mathbf{a}:$ allylic $=$ allyl; $\mathbf{8 b}:$ allylic $=$ methallyl; $8 \mathrm{c}:$ allylic $=$ crotyl ) were refined using a full-matrix least

[^16]square method. Hydrogen atoms were placed at calculated positions $(\mathrm{C}-\mathrm{H}=$ $0.95 \AA$ ) and kept fixed. All non-hydrogen atoms of $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (7a: allylic $=$ allyl; $7 \mathbf{b}:$ allylic $=$ methallyl $)$ and $\operatorname{Pd}\left(\eta^{3}\right.$-allylic $)\left(\eta^{5}-\mathrm{PhFCp}\right)(8 \mathbf{a}:$ allylic $=$ allyl; $\mathbf{8 b}$ : allylic $=$ methallyl; $8 \mathbf{c}$ : allylic $=$ crotyl $)$ were anisotropically refined. In the subsequent refinement, the function $\Sigma \omega\left(F_{\mathrm{o}}{ }^{2}-F_{\mathrm{c}}{ }^{2}\right)^{2}$ was minimized, where $\left|F_{\mathrm{o}}\right|$ and $\left|F_{\mathrm{c}}\right|$ are the observed and calculated structure factor amplitudes, respectively. The agreement indices are defined as $R 1=\Sigma\left(| | F_{0} \mid-\right.$ $\left.\left|F_{\mathrm{c}}\right| \mid\right) / \Sigma\left|F_{\mathrm{o}}\right|$ and $\mathrm{w} R 2=\left[\Sigma \omega\left(F_{\left.\left.\mathrm{o}^{2}-F_{\mathrm{c}}{ }^{2}\right)^{2} / \Sigma\left(\omega F_{\mathrm{o}}{ }^{4}\right)\right]^{1 / 2} .}\right.\right.$.

Electrochemical Measurements. Electrochemical measurements were performed using a BAS CV-50W voltammetric analyzer. A glassy carbon electrode was used as the working electrode. The counter electrode was a platinum coil, and reference electrode was a $\mathrm{Ag} / \mathrm{Ag}^{+}$electrode. Cyclic voltammetry (CV) was performed at a scan rate of $100 \mathrm{mV} / \mathrm{s}$. All half wave potentials $E_{1 / 2}=\left(E_{\mathrm{pc}}+E_{\mathrm{pa}}\right) / 2$, where $E_{\mathrm{pc}}$ and $E_{\mathrm{pa}}$ are the cathodic and anodic peak potentials, respectively. The potential was corrected against Fc/Fc.

## Chapter 3 Bucky Ferrocenes

## 3-1. Introduction

Ferrocene was discovered about fifty years ago. ${ }^{13}$ Ferrocene is the most important and famous organometallic compound because the discovery of ferrocene brought the remarkable development of organometallic chemistry. 45 On the other hand, fullerene ${ }^{1}$ has been received much attention because as a new type of carbon allotrope with football shape, it may be possible to apply as functional nano molecules because of its specific steric ${ }^{46}$ and electronic ${ }^{47}$ structures and light acceptability. ${ }^{48}$ Discovery of the method to synthesize large amount of fullerene promoted chemical research of the fullerene chemistry. ${ }^{49}$

Many kinds of fullerene-transition metal complexes have been synthesized and investigated for their properties. ${ }^{5}$ We thought that functional molecules with useful properties could be synthesized by combining of ferrocene and

[^17]fullerene, because these molecules may have properties of both ferrocene and fullerene. However, the formation of hybrid molecule $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60}\right)$, which will be formed by direct combining of ferrocene and $\mathrm{C}_{60}$, are expected to be difficult by theoretical calculations. ${ }^{50}$ One of the reasons of its difficulty is that hybrid molecule $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60}\right)$ has open-shell structure because total electrons of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60}\right)$ are odd number. If an odd number of substituents can be introduced on the fullerene sphere, hybrid molecule of ferrocene and fullerene must be synthesized because of its closed shell structure. We already reported the quantitative and regioselective synthesis of pentaorganofullerene derivatives $\mathrm{C}_{60} \mathrm{R}_{5} \mathrm{H}\left(\mathrm{R}=\mathrm{Me}, \mathrm{Ph}\right.$ etc)..$^{17,51}$ Deprotonated products of these molecules can coordinate as cyclopentadienyl ligands to transition metals. ${ }^{22,23,24,25,26}$ On the basis of this knowledge, I synthesized and reported its structure and electrochemical properties of "bucky ferrocene" (a hybrid molecule of ferrocene and fullerene derivatives). ${ }^{23}$ These investigations showed that bucky ferrocene is stable to air, heat, light and electrochemical reduction/oxidation. These results supported possibilities of construction of functional molecules by starting with bucky ferrocenes as components. In this thesis work, to examine the properties of bucky ferrocenes, I investigated the syntheses, oxidation, reduction and chemical functionalizations of bucky ferrocenes.

[^18]It is well known that ferrocene $\mathrm{FeCp}_{2}$ is oxidized reversibly to form ferrocenium cation $\mathrm{FeCp}_{2}{ }^{+}$. On the other hand, fullerene receive six-step one-electron reductions reversibly. ${ }^{47}$ Bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathbf{1 1}$, $\mathrm{C}_{6} \mathrm{Me}_{5}$ is abbreviated as MeFCp ) is oxidized reversively like ferrocene and is reduced reversively like fullerene. ${ }^{23}$ To investigate some properties of oxidation or reduction products of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathbf{1 1})$, I measured UV-vis, EPR, and Mössbauer spectra of these compounds. Since there is an electron spin in those oxidation or reduction products, it is expected that many applications as functional molecules with magnetism or electric conduction must be possible like oxidation or reduction products of ferrocene or fullerene. 52,53

Numerous studies have been reported on the chemical functionalizations of ferrocenes. ${ }^{54}$ One of the other properties of ferrocene is the aromaticity of cyclopentadienyl ligands. Thus, cyclopentadienyl moieties of ferrocene can receive electrophilic substitution reaction, for example, Friedel-Crafts reaction. The ${ }^{1} \mathrm{H}$ NMR measurements indicated that the cyclopentadienyl ligands of bucky ferrocenes also have aromaticity. ${ }^{55}$ I thus examined here Friedel-Crafts

[^19]acylation of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$. Since the cyclopentadienyl moiety of bucky ferrocene can be functionalized, it is expected to do wide variety of applications based on chemical functionalizations of bucky ferrocene.

## 3-2. Spectroscopic Measurements and Properties of Pentamethylated Bucky Ferrocene $\mathrm{Fe}\left(\boldsymbol{\eta}^{5}-\mathrm{Cp}\right)\left(\boldsymbol{\eta}^{5}-\mathrm{MeFCp}\right)$

The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra showed that bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)^{23}$ (11) has $C_{5 v}$ symmetry. In INEPT measurement, coupling constant ${ }^{1} \mathrm{~J}$ c- H of $\mathrm{C}\left(\mathrm{CH}_{3}\right)-\mathrm{H}\left(\mathrm{CH}_{3}\right)$ and $\mathrm{C}\left(\mathrm{C}_{5} \mathrm{H}_{5}\right)-\mathrm{H}\left(\mathrm{C}_{5} \mathrm{H}_{5}\right)$ are 129 and 159 Hz , which are typical values for coupling constant of $\mathrm{C}\left(\mathrm{CH}_{3}\right)-\mathrm{H}\left(\mathrm{CH}_{3}\right)$ and $\mathrm{C}\left(\mathrm{C}_{5} \mathrm{H}_{5}\right)-\mathrm{H}\left(\mathrm{C}_{5} \mathrm{H}_{5}\right)$. The vertical relaxation (T1) of proton signals are 0.55 s $\left(\mathrm{H}\left(\mathrm{CH}_{3} \mathrm{FCp}\right)\right)$ and $1.30 \mathrm{~s}\left(\mathrm{H}\left(\mathrm{C}_{5} \mathrm{H}_{5}\right)\right)$, which are typical values as $\mathrm{H}\left(\mathrm{CH}_{3}\right)$ and $\mathrm{H}\left(\mathrm{C}_{5} \mathrm{H}_{5}\right)$. Since the hydrogen atoms of the Cp ligand and those of methyl groups in the MeFCp ligand are in van der Waals contact, which was shown by the X-ray crystal structure analysis of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(11)$, I thought that five hydrogen atoms of the Cp ligand and five methyl groups of the MeFCp one are engaged like cogwheels and the Cp and MeFCp ligands rotate synchronously. Therefore, I measured ${ }^{1} \mathrm{H}$ NMR spectrum of (11) at low temperature ( 0 to $-50^{\circ} \mathrm{C}$ ), but I could not obtain the evidence of synchlonism between five hydrogen atoms of the Cp ligand and five methyl groups of the MeFCp one.

Next, I investigated stabilities of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathbf{1 1})$.

Bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathbf{1 1})$ is stable under heating at $200^{\circ} \mathrm{C}$ for 24 h in vacuo. Even in benzene, $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(11)$ is stable to irradiation of 400 W high pressure mercury lamp. Thus, it is expected that bucky ferrocenes become useful functional molecules stable under harsh condition. $\mathrm{C}_{60}$ can be excited from ${ }^{1} \mathrm{C}_{60}$ to ${ }^{1} \mathrm{C}_{60}{ }^{*}$ by irradiation of light, and ${ }^{1} \mathrm{C}_{60}{ }^{*}$ then goes to ${ }^{3} \mathrm{C}_{60}{ }^{*} .{ }^{56}$ When the energy of ${ }^{3} \mathrm{C}_{60}{ }^{*}$ is transferred to moleculer oxygen $\left({ }^{3} \mathrm{O}_{2}\right)$, singlet oxygen $\left({ }^{1} \mathrm{O}_{2}\right)$ forms. ${ }^{57}$ Thus $\mathrm{C}_{60}$ acts as photo-sensitizer (Scheme 3). ${ }^{58}$ To elucidate the ability of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)$ (11) as photo-sensitizer, I carried out the experiment as shown in eq 4.

[^20]Scheme 3. Formation of singlet oxygen by irradiation of $\mathrm{C}_{60}$.

Oxidation reaction of $\alpha$-terpinene in toluene was carried out in the presence of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathbf{1 1})(1.0 \mathrm{~mol} \%)$ as photo-sensitizer. In this reaction, a solution was irradiated by a 100 W tungsten lamp. As a result, ascaridole was obtained in $4.6 \%$ yield. This result showed that bucky ferrocene can act as a photo-sensitizer (ferrocene does not show the ability of photo-sensitizer) although this efficiency is much lower than that of $\mathrm{C}_{60}$ (ascaridole: $97 \%$ yield). The oxidation reaction did not proceed in the absence of $\mathrm{C}_{60}$ or bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right) \quad$ (11). The lower ability of bucky ferrocene
$\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)$ (11) compared with $\mathrm{C}_{60}$ indicated that the lifetime of triplet excited state of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathbf{1 1})$ is shorter than that of $\mathrm{C}_{60}$. After the reactions, bucky ferrocene was recovered without trace of other products (HPLC analyses).

## 3-3. Theoretical Calculations on Pentamethylated Bucky Ferrocene

Bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)$ (11) may be dissected into three $\pi$-conjugated systems ( $\mathrm{Cp}-\mathrm{Fe}$, the fullerene cyclopentadienide moiety and the bottom $\mathrm{C}_{50}$ part). We previously showed that the $50 \pi$ electron system of $\mathrm{C}_{60} \mathrm{Me}_{5}{ }^{-}$ is conjugated with cyclopentadienide moiety using $2 \pi$-orbital lobes inside the fullerene core (cf. green circle in Figure 9b) ${ }^{17}$.

Molecular orbitals of pentamethylated bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)$ (11) were calculated by DFT calculations for the geometry of the crystal structure ( $C_{5 v}$ symmetry) (Figure 9) (in collaboration with Dr. Masahiro Yamanaka). ${ }^{23}$ These experimental results suggested that such endohedral homoconjugation is also present in bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{6} \mathrm{Me}_{5}\right)(\mathbf{1 1})$ between the $\mathrm{C}_{50}$ part and the fullerene cyclopentadienide moiety, and even extends to the Cp-Fe one. The orbital picture in Figure 9 shows a fully extended $d-\pi$ conjugation system involving iron 3d and carbon 2 p-orbitals (Figure 9a). Note the endohedral in-phase interaction between the $C_{50}$ part and the fullerene cyclopentadienide moiety at their juncture (green circle, Figure 9b). The corresponding out-of-phase interaction is found as a higher energy orbital
(HOMO-8, $\mathrm{E}_{1},-6.54 \mathrm{eV}$ ).

Figure 9. Molecular orbital of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)$ (11) obtained by DFT calculations for the geometry of the crystal structure ( $C_{5 v}$ symmetry). (a) 3D Snapshot. (b) Contour plot of the HOMO-11 orbital ( $\left.\mathrm{E}_{1},-6.88 \mathrm{eV}\right)$.

Since the ferrocene moiety donates electron to the fullerene moiety, bucky ferrocene is expected to show a large dipole moment, which is calculated to be 5.6 D.

As a result, I have successfully created an entirely new class of $d-\pi$ conjugate system through face-to-face fusion of ferrocene and fullerene, in which an electron flows through the pentagonal "window" [the fullerene cyclopentadienide moiety in $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)$ (11)] shared by the two fragments.

## 3-4. Acylation of Cyclopentadienide Group of Pentamethylated Bucky

## Ferrocene

Ferrocene $\mathrm{FeCp}_{2}$ can act as a building block of functional molecules. ${ }^{54}$ For this to be achieved, it is important to functionalize the Cp moiety of ferrocene. In fact, many investigations on the derivatization of ferrocene have been reported. ${ }^{54}$ The most important is Friedel-Crafts acylation. These reactions are based on the aromatic nature of Cp moiety of ferrocene. Acyl ferrocenes $\mathrm{Fe}\left(\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COR}\right) \mathrm{Cp}$ are often used as starting materials of various ferrocene derivatives. ${ }^{59}$

The ${ }^{1} \mathrm{H}$ NMR measurement of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right) \mathbf{1 1}$ indicated that the Cp ring of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathbf{1 1})$ is aromatic. ${ }^{23}$ Thus, I examined the acylation of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)$ (11). The reaction of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)$ (11) with acyl chloride (acyl $=$ acetyl, benzoyl and cynnamoyl) and anhydrous aluminum chloride took place smoothly in $\mathrm{CS}_{2}$ (38-43\% yield) (eq 5). Acetylation of phenyl bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)(12)$ (see below) did not proceed under the same reaction

[^21]condition probably because of the steric hindrance of the five phenyl groups of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Ph}_{5}\right)$ (12).

APCI-MS spectra supported the structures of the acyl bucky ferrocenes $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COR}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(13 \mathrm{a}: \mathrm{R}=\mathrm{Me}, 13 \mathrm{~b}: \mathrm{R}=\mathrm{Ph}, 13 \mathrm{c}: \mathrm{R}=\mathrm{CH}=\mathrm{CHPh})$. The ${ }^{1} \mathrm{H}$ and the ${ }^{13} \mathrm{C}$ NMR spectra showed that the acyl cyclopentadienyl moiety is in $C_{s}$ symmetry and the MeFCp ligand is in $C_{5 v}$ symmetry. These results indicated that the rotation rates of acyl group, acyl cyclopentadienyl and FCp moieties around the $\mathrm{C}\left(\mathrm{COCH}_{3}\right)-\mathrm{C}(\mathrm{Cp})$ or $\mathrm{Fe}-\mathrm{Cp}$ or $\mathrm{Fe}-\mathrm{FC}$ p axis are faster than the relaxation time of NMR measurement. In the acetyl bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COMe}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(13 \mathrm{a})$, the proton signals of the methyl group (acetyl part) ( 2.62 ppm ) and the Cp moiety ( $5.21,5.42 \mathrm{ppm}$ ) were observed at lower magnetic field that those of $\mathrm{Fe}\left(\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COMe}\right) \mathrm{Cp}$ (Me: $2.40 \mathrm{ppm} ; \mathrm{Cp}: 4.50$, $4.77 \mathrm{ppm}),{ }^{60,61}$ suggesting the electron withdrawing nature of the FCp ligand.

[^22]In the IR spectra of acyl bucky ferrocenes $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COMe}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{1 3 a})$ and $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COPh}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{1 3 b})$, the absorption bands due to the carbonyl group are 1670 and $1640 \mathrm{~cm}^{-1}$, the value are smaller than those of the corresponding acyl ferrocene (166262,63 and $162764,65 \mathrm{~cm}^{-1}$ ) or acetyl pentamethylferrocene (1664 or $\left.1632 \mathrm{~cm}^{-1}\right)^{66}$ (Figure 10). A possible explanation of the result is that the electron withdrawing nature of the FCp ligand strengthens the carbonyl bonds. Lower wave number shift, which was caused by the exchange from the acetyl group to the benzoyl one, is due to conjugation between phenyl group and carbonyl one (Figure 10).

[^23]

Figure 10. Wave numbers of vibrations of carbonyl groups for acyl bucky ferrocenes, acyl ferrocenes and acyl pentamethylferrocene.

## 3-5. X-ray Crystal Structure of Acetyl Bucky Ferrocene

Dark red single crystals of acetyl bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COMe}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (13a) were obtained by recrystallization from $\mathrm{CS}_{2} / \mathrm{EtOH}$. An X-ray crystal structure analysis of this complex was performed (Figure 11, Table 8).

Figure 11. Molecular structure of acetyl bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COMe}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (13a) (30\% probability level ellipsoids. The solvent molecule in the unit cell is omitted for clarity). Comparison of the bond lengths with acetyl ferrocene and acetyl pentamethylferrocene.

The FCp ligands coordinate to the iron atom in an $\eta^{5}$-fashion. The Cp and FCp ligands have an eclipsed comformation, which stands in contrast to bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{1 1})$. Acetyl and Cp groups are tilted against the FCp plain. This result is due to steric repulsion between the acetyl and the methyl groups of the FCp ligand. The bond lengths of the acetyl bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COMe}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (13a) were comparable to those of acetyl ferrocene and acetyl pentamethylferrocene (Figure 11). The bond length of the carbonyl group $(1.22 \AA)$ of the acetyl bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COMe}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{1 3 a})$ is the same as those of acetyl ferrocene and
acetyl pentamethylferrocene. The bond lengths of $\mathrm{C}(\mathrm{Me})-\mathrm{C}(\mathrm{CO})(1.51 \AA)$ and $\mathrm{C}(\mathrm{CO})-\mathrm{C}(\mathrm{Cp})\left(1.48 \AA\right.$ ) of $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COMe}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{1 3 a})$ are also the same as those of acetyl ferrocene and acetyl pentamethylferrocene. The averaged bond lengths between $\mathrm{Fe}-\mathrm{C}(\mathrm{Cp})$, $\mathrm{Fe}-\mathrm{C}\left(\mathrm{Cp}^{*}\right)$ and $\mathrm{Fe}-\mathrm{C}(\mathrm{FCp})$ are 2.04, 2.05 and $2.09 \AA$, respectively. These results are in good accordance with the tendency of steric repulsion between acetyl ligand and $\mathrm{Cp}, \mathrm{C} \mathrm{p}^{*}$ or FCp ones. Another possible reason why the averaged bond length of $\mathrm{Fe}-\mathrm{C}(\mathrm{FCp})$ is longer than that of $\mathrm{Fe}-\mathrm{C}(\mathrm{Cp})$ or $\mathrm{Fe}-\mathrm{C}\left(\mathrm{Cp}^{*}\right)$ is that the overlap of d orbitals of iron atom and p orbitals of FCp ligand is not effective than those in $\mathrm{Fe}-\mathrm{C}(\mathrm{Cp})$ or $\mathrm{Fe}-\mathrm{C}\left(\mathrm{Cp}^{*}\right)$ bonds because of the spherical shape of FCp ligand.

## 3-6. Oxidation of Bucky Ferrocenes

It is well known that ferrocene $\mathrm{FeCp}_{2}$ can be transformed reversibly into ferrocenium $\left[\mathrm{FeCp}_{2}\right]^{+} \mathrm{X}^{-}\left(\mathrm{X}^{-}=\right.$counter anion $)$by oxidation. ${ }^{67}$ Cyclic voltammetry of bucky ferrocenes $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (11) and $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)$ (12) indicates that bucky ferrocenes $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right) \quad$ (11) and Fe $\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)(12)$ can be oxidized reversibly. Thus, it must be possible to obtain bucky ferroceniums by oxidation of bucky ferrocenes $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{1 1})$ and $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)(12)$ with a proper oxidant.

Preparations of bucky ferrocenium $\quad\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]^{+}$and

[^24]$\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right]\left(\eta^{5}-\mathrm{PhFCp}\right)\right]^{+}$were performed by the oxidation of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{1 1})$ and $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)(\mathbf{1 2})$ with ammoniumyl salt [ $\left.\left(4-\mathrm{BrC}_{6} \mathrm{H}_{4}\right)_{3} \mathrm{~N}\right]\left[\mathrm{SbCl}_{6}\right]$ (eq 6). The color of the THF solution of bucky ferrocenes $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (11) and $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)$ (12) changed from light orange to dark orange as oxidizer was added to the THF solution of bucky ferrocenes. At the time, the dark blue color of ammoniumyl salt disappeared immediately.

While bucky ferrocenium compounds $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (14) and $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (15) are insoluble in non-polar solvents, hexane and carbon disulfide, they are slightly soluble in polar organic solvent, benzonitrile, THF and DMF (however, insoluble in ethanol and acetonitrile).

## 3-7. UV-vis Spectra of Bucky Ferroceniums

By the oxidation of ferrocene FeCp 2 , the color changes from yellow to dark blue. ${ }^{67}$ This phenomenon is mainly due to ligand-metal charge transfer (LMCT).

To observe the change of color before and after oxidation of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{1 1})$, I measured the UV-vis spectra.

At the first stage, I measured UV-vis spectrum of bucky ferrocenium $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (14) under air (Figure 12). This spectrum is very different from that of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(11) .{ }^{23}$

Figure 12. UV-vis spectrum of bucky ferrocenium $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (14) in benzonitrile.

At the next stage, I examined the changes of the UV-vis spectra of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (11) under oxidation conditions at constant voltage (Figure 13). The UV-vis spectra changed slowly by the oxidition of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{1 1})$ at 800 mV (Figure 13 (a)). After 30 min , the UV-vis spectrum became the same as that of bucky ferrocenium $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (14). This result shows that bucky ferrocenium
can be obtained by both chemical and electrochemical oxidations. After the oxidation, reduction was performed at -600 mV (Figure 13 (b)). The UV-vis spectra changed reversibly, and after 130 min , the spectra became equal to that of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (11). This observation shows that bucky ferrocenium $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right](\mathbf{1 4})$ is thermally stable under electrochemical conditions.

Figure 13. Changes of UV-vis spectra of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (11) under oxidation conditions at constant voltage. (a) Oxidation of Fe( $\left.\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (11) ( $\mathrm{PhCN}, 800 \mathrm{mV}$ vs $\mathrm{Ag} / \mathrm{Ag}^{+}$). (b) Reduction after oxidation of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{1 1})$ at (a) (benzonitrile, -600 mV vs $\left.\mathrm{Ag} / \mathrm{Ag}^{+}\right)$.

While ferrocenium $\mathrm{FeCp}_{2}{ }^{+}$has a characteristic absorption at $617 \mathrm{~nm},{ }^{68}$ which is assigned as LMCT, such absorption could not be observed in the UV-vis spectrum of bucky ferrocenium $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (14). Two reasons can be suggested; One is that the absorbance of LMCT (in the case of ferrocene $\left.\mathrm{FeCp}_{2}, \varepsilon=420\right)$ in bucky ferrocenium $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (14) is much smaller than that of fullerene core ( $\varepsilon$ value can be a few thousand to a hundred thousand). The other is that the magnitude of the wavelength of LMCT is too small to observe, as in known for ferrocenes with an electron withdrawing ligand (Table 5). ${ }^{68}$

Table 5. Wave Lengths of LMCT in Some Ferrocenium Ions.

| $\mathrm{Fe}\left(\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{CH}_{3}\right)_{2}{ }^{+}$ | 645 nm |
| :--- | :--- |
| $\mathrm{Fe}\left(\mathrm{C}_{5} \mathrm{H}_{5}\right)_{2} 2^{+}$ | 617 nm |
| $\mathrm{Fe}\left(\mathrm{C}_{5} \mathrm{H}_{5}\right)\left(\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COCH}_{3}\right)^{+}$ | 529 nm |

${ }^{68}$ Prince, R. J. Chem. Soc., Chem. Commun. 1970, 280.

## 3-8. EPR Measurement of Bucky Ferrocenium

Since ferrocenium $\mathrm{FeCp}_{2}{ }^{+}$has an open-shell structure, it is EPR active. ${ }^{69}$ Cyclic voltammetry and Mössbauer spectrum (described below) of bucky ferroceniums $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (14) and $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (15) indicated that the oxidations of bucky ferrocenes $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (11) and $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right) \quad$ (12) occurred in its ferrocene moieties. Then $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (14) and $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (15) must be EPR active like ferrocenium $\mathrm{FeCp}_{2}{ }^{+}$. I measured EPR spectrum of $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right](14)$ as solid and solution phases at 4.4 K (Figure 14).

Figure 14. EPR spectrum of bucky ferrocenium $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (14).

[^25]The EPR signals of bucky ferrocenium $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (14) could not be observed at $25{ }^{\circ} \mathrm{C}$ as in the case of ferrocenium $\mathrm{FeCp}_{2}{ }^{+}$because spin-lattice relaxation time is very short. The $g$-values of $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (14) are $3.94\left(\mathrm{~g}_{\|}\right)$and $1.57\left(\mathrm{~g}_{\perp}\right)$, which are comparable to those in ferroceniums (Table 5). ${ }^{69}$

Table 6. The $g$-Values of Bucky Ferrocenium $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (14) and Some Ferroceniums ${ }^{a, b}$

## 3-9. Mössbauer Spectra of Bucky Ferrocenes and Bucky Ferroceniums

It is well known that ferrocene $\mathrm{FeCp}_{2}$ and ferrocenium $\left[\mathrm{FeCp}_{2}\right]^{+}$are Mössbauer active. ${ }^{70}$ To elucidate the environment around iron center of bucky ferrocenes $\operatorname{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (11) and $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)$ (12) and bucky ferrocenium $\quad\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right] \quad$ (14) and $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (15), I measured Mössbauer spectra of these complexes (Table 7).

[^26]Table 7. Isomer Shifts and Quadrupole Splitting of Bucky Ferrocenes and Bucky Ferroceniums. ${ }^{a}$

|  | I.S. ${ }^{b}(\mathrm{~mm} / \mathrm{s})$ | Q.S. ${ }^{c}(\mathrm{~mm} / \mathrm{s})$ |
| :--- | :--- | :--- |
| $\mathrm{FeCp}_{2}$ |  |  |
| $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{1 1})$ | $0.537(1)$ | $2.418(1)$ |
| $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)(\mathbf{1 2})$ | $0.586(4)$ | $2.475(4)$ |
|  |  | $2.471(1)$ |
| $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right](\mathbf{1 4})$ | $0.573(7)$ | $0.185(7)$ |
| $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right](\mathbf{1 5})$ | $0.612(9)$ | $0.108(9)$ |

${ }^{a}$ Measurements were performed at $90 \mathrm{~K} .{ }^{b}$ Isomer shift. ${ }^{c}$ Quadrupole splitting.

Mössbauer spectra of bucky ferrocenes $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (11) and $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)(\mathbf{1 2})$ and bucky ferrocenium $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (14) and $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (15), showed typical ones as ferrocene or ferrocenium. The values of isomer shifts and quadrupole splittings are comparable to those of ferrocene or ferrocenium. The results of both the UV-vis and ESR spectra and the Mössbauer ones indicate that the oxidation of bucky
ferrocene $\quad \operatorname{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right) \quad$ (11) $\quad$ provides bucky ferrocenium $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)\right]\left[\mathrm{SbCl}_{6}\right]$ (14) reversively.

## 3-10. UV-vis Spectra of Bucky Ferrocenates

Electrochemical measurement of the bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (11) showed that $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(11)$ received first reversible one-electron reduction and second irreversible one-electron one. ${ }^{23}$ I thus investigated the reductions of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{1 1})$ under constant voltages and measured changes of UV-vis spectra of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{1 1})$ (Figure 15).

The UV-vis spectra changed slowly by the reduction of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{1 1})$ at -1650 mV (Figure 15 (a)). After 120 min , the UV-vis spectrum did not change any more. After the reduction, oxidation was performed at 0 mV (Figure 15 (b)). The UV-vis spectra changed reversibly, and after 60 min , the spectra became the same as that of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(11)$. This observation shows that bucky ferrocenate 16 is thermally stable under electrochemical conditions. ${ }^{71}$

Next, I measured UV-vis spectra at -2000 mV (Figure 16). After 70 min , the spectrum did not change at all. The spectrum remained the same after re-oxidation. This observation indicated the decomposition of the bucky ferrocene species.

[^27]

Figure 15. Changes of UV-vis spectra of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (11) in benzonitrile under constant voltage. (a) Reduction of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{1 1})$ $\left(-1650 \mathrm{mV}\right.$ vs $\left.\mathrm{Ag} / \mathrm{Ag}^{+}\right)$. (a) Reduction of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (11) (-2000 mV vs $\left.\mathrm{Ag} / \mathrm{Ag}^{+}\right)$. (b) Oxidation after the reduction at $-2000 \mathrm{mV}(0 \mathrm{mV}$ vs $\left.\mathrm{Ag} / \mathrm{Ag}^{+}\right)$to show the irreversibility of the two-electron reductions.

## 3-11. Synthesis of Functionalized Bucky Ferrocenes

Various bucky ferrocenes could be synthesized by the use of ArFCp ligands $\left[\mathrm{Ar}=\mathrm{Ph}, 4-\mathrm{MeOC}_{6} \mathrm{H}_{4}, 3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}, 4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}, 3-\mathrm{BrCH}_{2} \mathrm{CH}(\mathrm{Br}) \mathrm{C}_{6} \mathrm{H}_{4}\right.$ and $\left.4-\mathrm{BrCH}_{2} \mathrm{CH}(\mathrm{Br}) \mathrm{C}_{6} \mathrm{H}_{4}\right]$ instead of MeFCp one. Phenyl bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)$ (12) was synthesized by the procedure similar to that reported for methyl bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (11) (eq 7). High resolution APCI-TOF-MS (+) data were consistent with the assigned structure. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR measurements of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)$ (12) showed that the Cp and FCp moieties have $C_{5 v}$ symmetry. These results show that the rotation rates of Cp and FCp moieties around the $\mathrm{Fe}-\mathrm{Cp}$ and Fe-FCp axis are faster than the relaxation time of NMR measurement.

As is the previous experiments, it seemed to be difficult to functionalize phenyl groups of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)$ (12). These difficulties must be due to the low nucleophilicity of aryl groups (fullerene part is an electron withdrawing group) and the difficulty of introducing functional
groups to five aryl groups at the same time. So I tried to synthesize functionalized bucky ferrocenes by constracting ferrocene moiety on five-fold functionalized aryl adducts of $\mathrm{C}_{60}$.

I synthesized 4-methoxyphenyl bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{MeOC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right](19)$ by the reaction of $\mathrm{C}_{60}\left(4-\mathrm{MeOC}_{6} \mathrm{H}_{4}\right)_{5} \mathrm{H}(\mathbf{1 8})$ with $\left[\mathrm{FeCp}(\mathrm{CO})_{2}\right]_{2}$ (eq. 8). After the purification by silica gel short path and recrystalization, bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{MeOC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (19) was obtained as air- and moisture-stable dark red crystals in $8 \%$ isolated yield. Structure assignment of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{MeOC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (19) was achieved by the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR and high resolution APCI-TOF-MS measurements.

Next, I tried to synthesize 3- or 4-vinylphenyl bucky ferrocenes because vinyl groups of these molecules are expected to be functionalized easily. As
starting materials, I synthesized pentaarylated fullerene derivatives $\mathrm{C}_{60}\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right)_{5} \mathrm{H}(20)$ and $\mathrm{C}_{60}\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right)_{5} \mathrm{H}$ (21) according to the synthetic method of $\mathrm{C}_{60} \mathrm{Ph}_{5} \mathrm{H}$. After the purification by silica gel and recrystalization, 3-vinylphenyl and 4-vinylphenyl fullerene derivatives $\mathrm{C}_{60}\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right)_{5} \mathrm{H}(20)$ and $\mathrm{C}_{60}\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right)_{5} \mathrm{H}(21)$ were obtained as orange powders in 89 and $47 \%$ isolated yield (eq 9). High resolution APCI-TOF-MS (+) measurements indicated the formation of $\mathrm{C}_{60}\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right)_{5} \mathrm{H}(20)$ and $\mathrm{C}_{60}\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right)_{5} \mathrm{H}(21)$. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR measurements were also consistent with the assigned structures $\left(C_{s}\right.$ symmetry). While the solubility of $\mathrm{C}_{60}\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right)_{5} \mathrm{H}$ (20) in organic solvent is much better than $\mathrm{C}_{60} \mathrm{Ph}_{5} \mathrm{H}$, that of $\mathrm{C}_{60}\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right)_{5} \mathrm{H}(21)$ is much lower than $\mathrm{C}_{60}\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right)_{5} \mathrm{H}(\mathbf{2 0})$.

According to the synthetic method of methyl or phenyl bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right) \quad(\mathbf{1 1}) \quad$ or $\quad \mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right) \quad$ (12), I synthesized 3-vinylphenyl bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (22) and 4-vinylphenyl bucky ferrocene $\operatorname{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (23). After the purification by silica gel short path and recrystalization, bucky ferrocenes $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FC} p\right]$ and $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (23) were obtained as air- and moisture-stable dark red crystals in 18 and $8.2 \%$ isolated yield (eq. 10). ${ }^{72}$ The ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ NMR measurements and APCI-MS indicated the formation of bucky ferrocene $\quad \mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right](23) .{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR measurements of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FC} p\right]$ and $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right](23)$ showed that the Cp and FCp moieties have $C_{5 v}$ symmetry. While bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (22) has good solubility ( $>20 \mathrm{mg} / \mathrm{CDCl}_{3} 0.6 \mathrm{~mL}$ ) as compared to phenyl bucky ferrocene $\quad \mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right) \quad$ (12), bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right](23)$ has low solubility ( $<9.0 \mathrm{mg} / \mathrm{CDCl}_{3} 0.6$ mL ).

[^28]

To investigate the easiness of functionalization of vinyl groups of bucky ferrocenes $\quad \mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right] \quad$ (22) and $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FC}\right]$ (23), I carried out bromination reactions of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FC}\right]$
and
$\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right] \quad$ (23). The reactions of
$\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FC}\right]$
and
$\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (23) with bromine gave brominated bucky ferrocenes $\quad \mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left\{3-\mathrm{BrCH}_{2} \mathrm{CH}(\mathrm{Br}) \mathrm{C}_{6} \mathrm{H}_{4}\right\} \mathrm{FCp}\right] \quad$ (24) and $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left\{4-\mathrm{BrCH}_{2} \mathrm{CH}(\mathrm{Br}) \mathrm{C}_{6} \mathrm{H}_{4}\right\} \mathrm{FCp}\right](25)$ in 59 and $83 \%$ isolated yield (eq 11). The ${ }^{1} \mathrm{H}$ NMR spectra indicated the formation of brominated bucky ferrocenes

$$
\begin{equation*}
\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left\{3-\mathrm{BrCH}_{2} \mathrm{CH}(\mathrm{Br}) \mathrm{C}_{6} \mathrm{H}_{4}\right\} \mathrm{FCp}\right] \tag{24}
\end{equation*}
$$ and $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left\{4-\mathrm{BrCH} 2 \mathrm{CH}(\mathrm{Br}) \mathrm{C}_{6} \mathrm{H}_{4}\right\} \mathrm{FCp}\right]$ (25) (mixture of isomers). ${ }^{73}$ The good yield of the formation of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left\{4-\mathrm{BrCH}_{2} \mathrm{CH}(\mathrm{Br}) \mathrm{C}_{6} \mathrm{H}_{4}\right\} \mathrm{FCp}\right](25)$ indicates

[^29]that functional groups on bucky ferrocenes could be derivatized effectively to useful functional ones.

## 3-12. X-ray Structures of Functionalized Bucky Ferrocenes

Dark red single crystals of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)$ (12) could be obtained by recrystalization from $\mathrm{CS}_{2} / \mathrm{EtOH}$. The structure of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)(\mathbf{1 2})$ was determined by X-ray analysis (Figure 17, Table 8 ). While the Cp and FCp ligands of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(11)$ are in a staggered conformation with each other, ${ }^{23}$ those of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)(12)$ are in an inperfect staggered conformation because of the steric repulsion between the Cp ligand and the five phenyl groups of FCp one. The averaged bond lengths of $\mathrm{Fe}-\mathrm{C}(\mathrm{Cp})$ and $\mathrm{Fe}-\mathrm{C}(\mathrm{FCp})$ are 2.062(5) and 2.084(4) $\AA$ in pentaphenylated bucky ferrocene $\operatorname{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)(12) .{ }^{23}$ The
bond length of $\mathrm{Fe}-\mathrm{C}(\mathrm{Cp})$ in bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)(12)$ is slightly longer than that in bucky ferrocene $\operatorname{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(11)(2.033 \AA)$ because of the steric repulsion between the Cp ligand and five phenyl groups of FCp ligand. In fact, since the closest C-H distances among bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)(12)$ is $2.91 \AA$ (between ortho-position carbon atoms of phenyl groups and hydrogen atoms of the Cp ligand), the ortho-position carbon atoms of phenyl groups and hydrogen atoms of the Cp ligand contact each other by van der Waals manner $(\mathrm{C}-\mathrm{H}=2.90 \AA)^{74}$ (Figure 18).

Figure 17. Molecular structure of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)$ (12) (30\% probability level ellipsoid. The solvent molecules in the unit cell are omitted for clarity).

[^30]

Figure 18. $\mathrm{H}-\mathrm{C}$ and $\mathrm{H}-\mathrm{H}$ distances of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)(12)$.

Dark red single crystals of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{MeOC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (19) could be obtained by recrystallization from $\mathrm{CS}_{2} / \mathrm{EtOH}$. Thus X-ray crystal structure analysis of this complex was performed (Figure 19, Table 8). The averaged bond lengths of $\mathrm{Fe}-\mathrm{C}(\mathrm{Cp})$ and $\mathrm{Fe}-\mathrm{C}(\mathrm{FCp})$ are 2.061(4) and 2.084(3) $\AA$ that are similar to those of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)(\mathrm{Fe}-\mathrm{C}(\mathrm{Cp})$ (ave): 2.062(5) $\AA$, Fe-C(FCp) (ave): 2.084(4) $\AA$ ). The averaged bond lengths of Me-O and O-Ar are 1.427(6) and $1.377(4) \AA$. These bond lengths are normal distances as the methoxy groups of anisole derivatives.

Figure 19. X-ray crystal structure of 4-methoxyphenyl bucky ferrocene Fe( $\left.\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{MeOC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (19). (a) ORTEP drawing (30 \% probability level ellipsoid). (b) Front view. (c) Top view.

Dark red single crystals of bucky ferrocenes

$$
\begin{equation*}
\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FC}\right] \tag{22}
\end{equation*}
$$

and
$\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (23) could be obtained by recrystallization from $\mathrm{CS}_{2} / \mathrm{EtOH}$. Then X-ray crystal structure analyses of these complexes were performed (Figures 20 and 21, Table 8). While the plane of Cp ligand tilts slightly against the plane of FC p one because of steric repulsion between Cp ligand and two vinyl groups in $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (22), the planes of Cp and FCp ligands are parallel in $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (23). The conformation of five vinyl groups
is various. The averaged bond lengths of $\mathrm{Fe}-\mathrm{C}(\mathrm{Cp}), \mathrm{Fe}-\mathrm{C}(\mathrm{FCp}), \mathrm{CH}_{2}=\mathrm{CH}-$ and $=\mathrm{CH}_{2}-\mathrm{Ar}$ are typical distances as $\mathrm{Fe}-\mathrm{C}(\mathrm{Cp}), \mathrm{Fe}-\mathrm{C}(\mathrm{FCp})$ or vinyl groups of styrene derivatives.

Figure 20. X-ray crystal structure of 3-vinylphenyl bucky ferrocene Fe $\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FC}\right]$ (22). (a) ORTEP drawing (30 \% probability level ellipsoid). (b) Front view. (c) Top view.

X-ray crystal structure of 4-vinylphenyl bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FC}\right]$ (23). (a) ORTEP drawing (30 \% probability level ellipsoid). (b) Front view. (c) Top view.

## 3-13. Conclusion

Bucky ferrocenes are very stable to water, dioxygen, heat and light. Theoretical calculations, IR and electrochemical measurements indicate that there is an electronic communication between fullerene core and Fe-Cp moiety. Bucky ferrocenes can be derivatized by some ways; acylation, oxidation and reduction. Given the versatile electro- and photochemistry of the fullerene group, the flexibility of the synthesis of the FCp ligand, ${ }^{17}$ and self-assembly of
the FCp structure, ${ }^{28,75}$ I anticipate that these molecules will lead to a new world of carbon clusters in catalysis and materials science.

## 3-14. Experimental

General Procedure. All manipulations were carried out under nitrogen or argon atmosphere using standard Schlenk techniques. THF was distilled from $\mathrm{Na} / \mathrm{K}$ alloy and thoroughly degassed by trap-to-trap distillation. Carbon disulfide, 1,2-dichlorobenzene, benzonitrile and dichloromethane were distilled from $\mathrm{CaH}_{2}$. Acetyl chloride, benzoyl chloride and sinnamoyl chloride were distilled before use. Aluminum trichloride was sublimed before use. $\mathrm{C}_{60}\left(4-\mathrm{MeOC}_{6} \mathrm{H}_{4}\right)_{5} \mathrm{H}^{17 \mathrm{~b}}$ and $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)^{23}$ were prepared according to the literature. $\left[\mathrm{FeCp}(\mathrm{CO})_{2}\right]_{2}$ and $\left[\left(4-\mathrm{BrC}_{6} \mathrm{H}_{4}\right)_{3} \mathrm{~N}\right]\left[\mathrm{SbCl}_{6}\right]$ were purchased from Acros Organics and Sigma-Aldrich Co. and used as received. $\mathrm{Br}_{2}$ was used as received.

Preparative HPLC separations were performed by use of Bucky Prep. column (Nakalai Tesque Co., $20 \mathrm{~mm} \times 250 \mathrm{~mm}$ ).
${ }^{1} \mathrm{H}(400 \mathrm{MHz})$ and ${ }^{13} \mathrm{C}(100 \mathrm{MHz})$ NMR spectra were recorded using JEOL EX-400 spectrometer. Proton chemical shift are reported relative to $\mathrm{Me}_{4} \mathrm{Si}$ $\left(\mathrm{CDCl}_{3}\right)$ at $\delta 0.00 \mathrm{ppm}$ or residual solvent peaks $\left(\mathrm{CDCl}_{3}\right.$ at $\left.\delta 7.26 \mathrm{ppm}\right)$. Carbon chemical shifts are reported relative to $\mathrm{CDCl}_{3}$ at $\delta 77.00 \mathrm{ppm}$. Other spectra

[^31]were recorded by the use of the following instruments: IR, JASCO IR-420 and ReactIR 1000; UV/vis spectra, HITACHI U3500 and Shimadzu SPD-6A; Mass spectra, Shimadzu LCMS-QP8000 and JEOL Accu TOF (JMS-T100LC). Elemental Analyses were performed at organic elemental analysis laboratory in this department.

Synthesis of $\mathrm{Fe}\left(\boldsymbol{\eta}^{5}-\mathrm{Cp}\right)\left(\boldsymbol{\eta}^{5}-\mathrm{PhFCp}\right)(12)$ : A mixture of $\mathrm{C}_{60} \mathrm{Ph}_{5} \mathrm{H}(17)(200 \mathrm{mg}$, $0.181 \mathrm{mmol})$ and $\left[\mathrm{FeCp}(\mathrm{CO})_{2}\right]_{2}(320 \mathrm{mg}, 0.900 \mathrm{mmol})$ in benzonitrile $(40.0 \mathrm{~mL})$ was stirred at $180^{\circ} \mathrm{C}$ for 19.5 h . After evaporation of the solvent, the crude mixture was diluted with toluene, and the solution was passed through a pad of silica gel. Solvent was removed in vacuo, and the mixture was recrystalized from $\mathrm{CS}_{2} /$ hexane to obtain $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)(12)$ as air stable dark red microcrystals (171 mg, 77\% yield). $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)(12):{ }^{1} \mathrm{H}$ NMR (400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 3.21(\mathrm{~s}, 5 \mathrm{H}, \mathrm{Cp}), 7.33-7.37$ (m, 10H, Ph), 7.39-7.40 (m. 5H, Ph), 7.93-7.95 (m, 10H, Ph); ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3} / \mathrm{CS}_{2}=1 / 1$ ) $\delta 3.16(\mathrm{~s}, 5 \mathrm{H}, \mathrm{Cp})$, 7.31-7.35 (m, 10H, Ph), 7.37-7.41 (m. 5H, Ph), 7.89-7.91 (m, 10H, Ph); ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3} / \mathrm{CS}_{2}=1 / 1$ ) $\delta 58.23$ (5C), $73.20(5 \mathrm{C}), 92.47(\mathrm{~s}, 5 \mathrm{C}), 127.41$ (5C), 127.47 (10C), 128.97 (10C), 142.82 (5C), 142.92 (10C), 143.66 (10C), 147.03 (5C), 147.81 (10C), 148.06 (5C), 152.14 (10C); IR $\left(\mathrm{CS}_{2}\right) v_{\mathrm{C}-\mathrm{H}(\mathrm{Cp})} / \mathrm{cm}^{-1} 3101$; UV-vis $(1.0 \times$ $10^{-5} \mathrm{~mol} \cdot \mathrm{~L}^{-1}$ in $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) \lambda_{\max }(\varepsilon) 260$ (84700), 295 (57300, shoulder), 351 (23600), 394 (12200), 475 (4330, shoulder) nm; APCI-MS: $m / z=1226\left(\mathrm{M}^{+}\right)$; HR-APCI-MS ${ }^{(+)} m / z$; found: 1226.1708; calcd for $\operatorname{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)(\mathbf{1 2 ) : ~ 1 2 2 6 . 1 7 0 1 .}$

Synthesis of $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COCH}_{3}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ (13a). To a mixture of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(11)(50.1 \mathrm{mg}, 54.6 \mu \mathrm{~mol})$ and $\mathrm{AlCl}_{3}(30.0 \mathrm{mg}, 225 \mu \mathrm{~mol})$, a solution of $\mathrm{CH}_{3} \mathrm{COCl}(16.0 \mu \mathrm{~L}, 225 \mu \mathrm{~mol})$ in $\mathrm{CS}_{2}(3.0 \mathrm{~mL})$ was added. After stirring at $25^{\circ} \mathrm{C}$ for 40 min , the reaction mixrure was quenched with methanol $(0.5 \mathrm{~mL})$. The mixture was diluted with toluene and was washed with water. The organic layer was dried with $\mathrm{MgSO}_{4}$ for 30 min and was concentrated under reduced pressure. After preparative HPLC separation [Bucky Prep. (Nacalai Tesque Co., $20 \mathrm{~mm} \times 250 \mathrm{~mm}$ ), toluene $/ i-\mathrm{PrOH}=7 / 3$, flow rate $=18$ $\mathrm{mL} / \mathrm{min}$, retention time $=8.5-9.5 \mathrm{~min}], \mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COCH}_{3}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(13 \mathrm{a})$ ( $19.7 \mathrm{mg}, 38 \%$ yield) was obtained as air stable reddish orange microcrystals: ${ }^{1} \mathrm{H}$ NMR (400 MHz, $\mathrm{CDCl}_{3}$ ) $\delta 2.53(\mathrm{~s}, 15 \mathrm{H}), 2.62(\mathrm{~s}, \mathrm{Me}), 5.22\left(\mathrm{t},{ }^{3} \mathrm{~J}=2.0 \mathrm{~Hz}, 2 \mathrm{H}\right), 5.44$ $\left(\mathrm{t},{ }^{3} \mathrm{~J}=2.0 \mathrm{~Hz}, 2 \mathrm{H}\right) ;{ }^{1} \mathrm{H}$ NMR (400 MHz, $\left.\mathrm{CDCl}_{3} / \mathrm{CS}_{2}=1 / 1\right) \delta 2.55(\mathrm{~s}, 15 \mathrm{H}), 2.62(\mathrm{~s}$, 3H), $5.19\left(\mathrm{t},{ }^{3} \mathrm{~J}=1.8 \mathrm{~Hz}, 2 \mathrm{H}\right), 5.40\left(\mathrm{t},{ }^{3} \mathrm{~J}=1.8 \mathrm{~Hz}, 2 \mathrm{H}\right) ;{ }^{13} \mathrm{C}$ NMR ( 100 MHz , $\left.\mathrm{CDCl}_{3} / \mathrm{CS}_{2}=1 / 1\right) \delta 29.25$ (5C), 29.90 (1C), 50.27 (5C), 69.95 (2C), 71.33 (2C), 81.92 (1C), 92.65 (5C), 143.04 (10C), 143.57 (10C), 146.68 (5C), 147.73 (10C), 147.94 (5C), 153.79 (10C), 201.94 (1C); IR ( $\mathrm{KBr}, v(\mathrm{CO}) / \mathrm{cm}^{-1}$ ) 1670; UV-vis (1.0x10-5 $\mathrm{mol} \mathrm{Le}^{-1}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) $\lambda_{\max }(\varepsilon) 239$ (61900), 258 (55000, shoulder), 273 (50300, shoulder), 354 (13100, shoulder), 395 (6710) nm; APCI-MS ( $\pm$ ) $m / z=958$ ( ${ }^{ \pm}$); HR-APCI-MS (+) $m / z$; found: 959.1117; calcd for $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COCH}_{3}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(13 a)$ : 959.1125.

Synthesis of $\mathrm{Fe}\left(\boldsymbol{\eta}^{5}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COC}_{6} \mathrm{H}_{5}\right)\left(\eta^{5}-\mathrm{MeFCp}\right) \quad$ (13b). To an orange suspension of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (22) ( 18.2 mg , $13.4 \mu \mathrm{~mol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5.0 \mathrm{~mL}), 2.0 \% \mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution of $\mathrm{Br}_{2}(6.88 \mathrm{~mL}, 134 \mu \mathrm{~mol})$ was added. After stirring at $25^{\circ} \mathrm{C}$ for 2 h , the solvent and $\mathrm{Br}_{2}$ was evaporated in vacuo. Preparative HPLC separations [Bucky Prep. (Nakalai Tesque Co., $20 \mathrm{~mm} \times 250$ $\mathrm{mm})$, toluene $/$ hexane $=1 / 1$, flow rate $=20 \mathrm{~mL} / \mathrm{min}$, retention time $=12.0-13.0$ min] afforded $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(3-\mathrm{BrCH}_{2} \mathrm{CH}(\mathrm{Br}) \mathrm{C}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right](24)(16.9 \mathrm{mg}, 59 \%$ yield $)$ as reddish orange solid; ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 3.56(\mathrm{~s}, 5 \mathrm{H}, \mathrm{Cp}), 4.02(\mathrm{~m}$, $\left.10 \mathrm{H}, \mathrm{BrCH}_{2} \mathrm{CH}(\mathrm{Br})-\right), 4.67\left(\mathrm{~m}, 5 \mathrm{H}, \mathrm{BrCH}_{2} \mathrm{CH}(\mathrm{Br})-\right), 7.58(\mathrm{~m}, 5 \mathrm{H}, \mathrm{Ar}), 7.68(\mathrm{~m}, 5 \mathrm{H}$, Ar), 7.87 (s, 5H, Ar), 7.97 (m, 5H, Ar); ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3} / \mathrm{CS}_{2}=1 / 3$ ) $\delta$ 3.40-3.43 (m, 5H), 3.93-3.97 (m, 10H), 4.56-4.61 (m, 5H), 7.49-7.51 (m, 5H, Ar), 7.57-7.66 (m, 5H, Ar), 7.78-7.79 (m, 5H, Ar), 7.87-7.89 (m, 5H, Ar); IR (powder, $\left.\mathrm{cm}^{-1}\right)$ v 2958 (w), 2921 (m), 2852 (w), 1723 (m), 1713 (w), 1600 (w), 1584 (m), 1486 (m), 1463 (m), 1441 (m), 1416 (m), 1285 (w), 1262 (m), 1239 (w), 1216 (w), 1202 (w), 1177 (w), 1158 (m), 1109 (m), 1007 (m), 901 (w), 874 (w), 822 (m), 797 (s), 754 (m), $699(\mathrm{~s}), 666(\mathrm{~m})$; UV-vis (toluene/2-propanol $=7 / 3) \lambda_{\max } 286,313$ (shoulder), 351, 395, 471.

Synthesis of $\mathrm{Fe}\left(\boldsymbol{\eta}^{5}-\mathrm{Cp}\right)\left[\boldsymbol{\eta}^{5}-\left(4-\mathrm{BrCH}_{2} \mathrm{CH}(\mathrm{Br}) \mathrm{C}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (25). To an orange solution of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (23) (3.4 mg, $2.50 \mu \mathrm{~mol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.0 \mathrm{~mL}), 2.0 \% \mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution of $\mathrm{Br}_{2}(1.29 \mathrm{~mL}, 25.0 \mu \mathrm{~mol})$ was added. After stirring at $25^{\circ} \mathrm{C}$ for 2 h , the solvent and $\mathrm{Br}_{2}$ were evaporated in vacuo. Preparative HPLC separations [Bucky Prep. (Nakalai Tesque Co., $20 \mathrm{~mm} \times 250$ $\mathrm{mm})$, toluene $/$ hexane $=1 / 1$, flow rate $=20 \mathrm{~mL} / \mathrm{min}$, retention time $=18.0-19.5$ min] afforded $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{BrCH}_{2} \mathrm{CH}(\mathrm{Br}) \mathrm{C}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right](25)(4.5 \mathrm{mg}, 83 \%$ yield) as reddish orange solid; ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 3.16(\mathrm{~s}, 5 \mathrm{H}, \mathrm{Cp})$, 4.05-4.17 (m, 10H, $\left.\mathrm{BrCH}_{2} \mathrm{CH}(\mathrm{Br})-\right), 5.20\left(\mathrm{~m}, 5 \mathrm{H}, \mathrm{BrCH}_{2} \mathrm{CH}(\mathrm{Br})-\right), 7.40(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Ar}), 7.91$ (d, $\left.{ }^{3} \mathrm{~J}=8.0 \mathrm{~Hz}, 10 \mathrm{H}, \mathrm{Ar}\right) ;{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3} / \mathrm{CS}_{2}=1 / 3$ ) $\delta 3.08-3.09(\mathrm{~m}, 5 \mathrm{H})$, 4.02-4.03 (m, 5H), 4.10-4.11 (m, 5H), 5.12-5.13 (m, 5H), 7.34-7.35 (m, 10H, Ar), 7.83-7.84 (m, 10H, Ar); IR (powder, $\mathrm{cm}^{-1}$ ) v 2952 (w), 2925 (m), 2850 (w), 1727 (w), 1605 (w), 1511 (w), 1414 (m), 1287 (m), 1264 (w), 1235 (m), 1200 (m), 1160 (w), 1131 (m), 1109 (m), 1019 (w), 1007 (w), 961 (w), 911 (m), 899 (s), 847 (m), 830 (m), 820 (s), $764(\mathrm{w}), 739(\mathrm{~m}), 710(\mathrm{~m})$; UV-vis (toluene/2-propanol $=7 / 3) \lambda_{\max }$ 286, 313 (shoulder), 351, 395, 463 (shoulder).

Theoretical calculations of bucky ferrocene $\mathrm{Fe}\left(\boldsymbol{\eta}^{5}-\mathrm{Cp}\right)\left(\boldsymbol{\eta}^{5}\right.$-MeFCp) (11). Calculations were performed by the hybrid DFT method (B3LYP) with the GAUSSIAN 98 program package (Frisch, M. J. et al.: Gaussian Inc., Pittsburgh, Pennsylvania, 1998). To obtain the molecular orbital (Kohn-Sham orbital), the molecular geometry including the carbon and iron atoms was fixed at an
average crystallographic structure of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(11)\left(\mathrm{C}_{5 \mathrm{v}}\right)$, and the positions of the hydrogen atoms were first optimised under $C_{5 v}$ symmetry using the Ahlrichs-TZV all-electron basis set for the Fe atom ${ }^{76}$ and the $6-31 \mathrm{G}(\mathrm{d})$ basis set for the C and H atoms.

X-ray Diffraction. Crystals of acetyl bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)$ (12), $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COCH}_{3}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathbf{1 3 a}), \mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{MeOC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (19), $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ and $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (23) suitable for the X-ray diffraction study were mounted on a MacScience DIP2030 Imaging Plate diffractometer for data collection using $\mathrm{MoK} \alpha$ (graphite monochromated, $\lambda=0.71069 \AA$ ) radiation. Crystal data and data statistics are summarized in Table 8. The structures of the complexes $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right) \quad$ (12), $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COCH}_{3}\right)\left(\eta^{5}-\mathrm{MeFCp}\right) \quad$ (13a), $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{MeOC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right](19), \quad \mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ and $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (23) were solved by the directed method (SHELXS-97) ${ }^{43}$ and expanded using Fourier techniques (DIRDIF-94). ${ }^{44}$ The positional parameters and thermal parameters of non-hydrogen atoms of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right) \quad(\mathbf{1 2}), \quad \mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COCH}_{3}\right)\left(\eta^{5}-\mathrm{MeFCp}\right)$ $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{MeOC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right] \quad(19), \quad \mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ and $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (23) were refined using a full-matrix least square method. Hydrogen atoms were placed at calculated positions (C-H

[^32]$=0.95 \AA$ A) and kept fixed. All non-hydrogen atoms of $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left(\eta^{5}-\mathrm{PhFCp}\right)(12)$, $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{COCH}_{3}\right)\left(\eta^{5}-\mathrm{MeFCp}\right) \quad$ (13a), $\quad \mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{MeOC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right] \quad$ (19), $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(3-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FC} p\right]$ and $\mathrm{Fe}\left(\eta^{5}-\mathrm{Cp}\right)\left[\eta^{5}-\left(4-\mathrm{CH}_{2}=\mathrm{CHC}_{6} \mathrm{H}_{4}\right) \mathrm{FCp}\right]$ (23) were anisotropically refined. In the subsequent refinement, the function $\Sigma \omega\left(F_{o_{0}}{ }^{2}-F_{\mathrm{c}}^{2}\right)^{2}$ was minimized, where $\left|F_{\mathrm{o}}\right|$ and $\left|F_{\mathrm{c}}\right|$ are the observed and calculated structure factor amplitudes, respectively. The agreement indices are defined as $R 1=\Sigma\left(| | F_{0} \mid-\right.$ $\left.\left|F_{\mathrm{c}}\right| \mid\right) / \Sigma\left|F_{\mathrm{o}}\right|$ and $\mathrm{w} R 2=\left[\Sigma \omega\left(F_{\left.\left.\mathrm{o}^{2}-F_{\mathrm{c}}{ }^{2}\right)^{2} / \Sigma\left(\omega F_{\mathrm{o}}{ }^{4}\right)\right]^{1 / 2} .}^{\text {. }}\right.\right.$

Electrochemical Measurements. Electrochemical measurements were performed using a BAS CV-50W voltammetric analyzer. A glassy carbon electrode was used as the working electrode. The counter electrode was a platinum coil, and reference electrode was a $\mathrm{Ag} / \mathrm{Ag}^{+}$electrode. Cyclic voltammetry (CV) was performed at a scan rate of $100 \mathrm{mV} / \mathrm{s}$. All half wave potentials $E_{1 / 2}=\left(E_{\mathrm{pc}}+E_{\mathrm{pa}}\right) / 2$, where $E_{\mathrm{pc}}$ and $E_{\mathrm{pa}}$ are the cathodic and anodic peak potentials, respectively. The potential was corrected against $\mathrm{Fc} / \mathrm{Fc}^{+}$.

# Chapter 4 Synthesis of Fullerene-Transition Metal Complexes by the Use of Fullerene Halide 

## 4-1. Introduction

I and the Nakamura group already reported the syntheses of pentaorgano fullerene ${ }^{17,36}$-transition metal complexes by transmetalation, $, 2,25,26$ the reactions via C-H bond activation ${ }^{23}$ and hydrometallation reaction. ${ }^{22}$ In these complexes, pentaorgano fullerene ligand acts as a cyclopentadienide. As the standard synthetic methods of cyclopentadienyl-transition metal complexes, not only transmetalation or the reactions via C-H bond activation reaction but also the reactions between cyclopentadienyl halides with transition metal ate complexes or oxidative addition reactions of cyclopentadienyl halides with low valent transition metal complexes, are well known. As fullerene halides $\mathrm{C}_{60} \mathrm{R}_{5} \mathrm{X}(\mathrm{X}=$ halide), $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Cl}(\mathbf{2 8 b})^{77}$ and $\mathrm{C}_{60} \mathrm{Ph}_{5} \mathrm{Cl}(\mathbf{2 9 b})^{78}$ were already reported. The chloride $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Cl}(\mathbf{2 8 b})$ was isolated in $4.5 \%$ yield by silica gel column chromatography and HPLC separations of the many products obtained by the reaction of $\mathrm{C}_{60} \mathrm{Cl}_{6}{ }^{79}$ with methyllithium. The Friedel-Crafts reaction of $\mathrm{C}_{60} \mathrm{Cl}_{6}{ }^{79}$ with benzene in the presence of $\mathrm{FeCl}_{3}$ gave (29b) in $68 \%$ yield. The problems of

[^33]these synthetic reactions are low yield or limitation that only chlorides can be synthesized. These fullerene chlorides have not been used as starting materials of the synthesis of fullerene-transition metal complexes. In this thesis, I prepared fullerene halides $\mathrm{C}_{60} \mathrm{R}_{5} \mathrm{X}$ (28a: $\mathrm{R}=\mathrm{Me}, \mathrm{X}=\mathrm{F} ; \mathbf{2 8 b}$ : $\mathrm{R}=\mathrm{Me}, \mathrm{X}=\mathrm{Cl} ; \mathbf{2 8 c}$ : $\mathrm{R}=\mathrm{Me}, \mathrm{X}=\mathrm{Br} ; \mathbf{2 8 d}: \mathrm{R}=\mathrm{Me}, \mathrm{X}=\mathrm{I} ; 29 \mathrm{a}: \mathrm{R}=\mathrm{Ph}, \mathrm{X}=\mathrm{F} ; \mathbf{2 9 b}: \mathrm{R}=\mathrm{Ph}, \mathrm{X}=\mathrm{Cl} ; \mathbf{2 9} \mathbf{c}: \mathrm{R}$ $=\mathrm{Ph}, \mathrm{X}=\mathrm{Br})$ and synthesized fullerene-transition metal complexes $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{3}(\mathbf{3 1}), \operatorname{FeBr}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (32) and $\mathrm{Co}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (33) by use of fullerene bromide $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c). These reactions are the first example of the synthesis of pentaorgano fullerene-metal complexes by the reactions between fullerene halides and transition metal complexes. It is expected that many kinds of fullerene-transition metal complexes could be obtained by use of not only transmetalation or C-H bond activation reaction or hydrometallation reaction but also the reactions between fullerene halides and transition metal complexes.

## 4-2. Synthesis and Characterization of Fullerene Halides

Fullerene halides $\mathrm{C}_{60} \mathrm{R}_{5} \mathrm{X}$ (28a: $\mathrm{R}=\mathrm{Me}, \mathrm{X}=\mathrm{F} ; \mathbf{2 8 b}: \mathrm{R}=\mathrm{Me}, \mathrm{X}=\mathrm{Cl}$; 28c: $\mathrm{R}=$ Me, $X=B r ; 28 d: R=M e, X=I ; 29 a: R=P h, X=F ; 29 b: R=P h, X=C l, 29 c: R=$ $\mathrm{Ph}, \mathrm{X}=\mathrm{Br})$ could be synthesized by the reaction of $\mathrm{K}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{R}_{5}\right)(26: \mathrm{R}=\mathrm{Me} ; 27$ : $\mathrm{R}=\mathrm{Ph})^{17}\left(\mathrm{C}_{60} \mathrm{R}_{5}\right.$ is abbreviated as RFCp) with N -fluoropyridinium triflate, N -chloro, N -bromo and N -iodo succinimide (eq 11). These reactions proceeded smoothly in benzene at $25{ }^{\circ} \mathrm{C}$. However, iodide $\mathrm{C}_{6} \mathrm{Ph}_{5} \mathrm{I}$ could not be obtained.

In the synthesis of fluoride $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{~F}$ (28a), $\mathrm{C}_{60} \mathrm{Me}_{5}$ (pyridyl) (30) was obtained as a side product. While fluoride $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{~F}$ (28a), $\mathrm{C}_{60} \mathrm{Ph}_{5} \mathrm{~F}$ (29a), chloride $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Cl}$ (28b), $\mathrm{C}_{6} \mathrm{Ph}_{5} \mathrm{Cl}$ (29b) and bromide $\mathrm{C}_{6} \mathrm{Me}_{5} \mathrm{Br}$ (28c), $\mathrm{C}_{60} \mathrm{Ph}_{5} \mathrm{Br}$ (29c) are air and moisture stable reddish orange solid, iodide $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{I}(\mathbf{2 8 d})$ is sensitive to air and decompose to oxidation products of $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{H}$.

28: $\mathrm{R}=\mathrm{Me}$
28a: $X=F \quad 19 \%$
28b: $X=$ Cl 55\%
28c: $X=B r$ 64\%
28d: $X=1 \quad 47 \%$
29a: $X=F \quad 92 \%$
29b: $X=\mathrm{Cl}$ 55\%
29c: $X=B r \quad 86 \%$

APCI-MS spectra of products in these reactions indicated the formation of fullerene halides 28a-c and 29a-c. In the ${ }^{1} \mathrm{H}$ NMR spectra of pentamethylated fullerene halides $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{~F}$ (28a), $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Cl}$ (28b) and $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c), three singlet proton signals assigned as methyl groups were observed in the ratio 2 : $2: 1$. These observations show $C_{s}$ symmetry of 28a-c. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of fullerene halides $\mathrm{C}_{60} \mathrm{Ph}_{5} \mathrm{~F}$ (29a), $\mathrm{C}_{60} \mathrm{Ph}_{5} \mathrm{Cl}$ (29b) and $\mathrm{C}_{60} \mathrm{Ph}_{5} \mathrm{Br}$ (29c) indicated that 29a-c also have $C_{s}$ symmetry. In the ${ }^{1} \mathrm{H}$ NMR spectrum of iodide
$\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{I}$ (28d), only one singlet signal, corresponded to protons of methyl groups, was observed. These observations show that $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{I}$ (28d) has $\mathrm{C}_{5 v}$ symmetry. A possible explanation for this observation is that since ion radius of iodide ion is large, there is no covalent bond between iodo atom and one carbon atom of FCp moiety. This observation is contranst to an $\eta^{1}$-coordination of Cp*I. ${ }^{80}$

To conclusively determine the structure of pentamethyl[60]fullerene bromide $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c), a single crystal X-ray diffraction study was performed (Figure 22, Table 9). Recrystallization of $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c) from $\mathrm{CS}_{2} /$ ethanol gave red single crystals composed of a 1:1 mixture of $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c) and $\mathrm{CS}_{2}$. Bromo atom combines with one carbon atom of cyclopentadiene moiety of $\mathrm{C}_{60} \mathrm{Me}_{5}$.

[^34]

Figure 22. Molecular structure of fullerene bromide $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c) with $30 \%$ probability level ellipsoids. The $\mathrm{CS}_{2}$ molecule found in the unit cell is omitted for clarity.

## 4-3. Electrochemical Measurement of Fullerene Halides

The electrochemical properties of fullerene halides $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Cl}$ (28b) and $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c) were examined (Figure 23). While fullerene chloride $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Cl}$ (28b) and bromide $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c) were not oxidized, could be reduced irreversively. After the reductions, $\mathrm{C}_{6} \mathrm{Me}_{5}{ }^{-}$and its redox species were observed. These results show that the $\mathrm{C}-\mathrm{X}(\mathrm{X}=\mathrm{Cl}, \mathrm{Br})$ bonds of fullerene halides are cleaved by reduction. The fact that the first step is two-electrons reduction indicates that radical species $\mathrm{C}_{60} \mathrm{Me}_{5}{ }^{\circ}\left(\mathbf{A}^{\circ}\right)$, which forms by the cleavage of the C-X bonds, is reduced immediately to form anion $\mathrm{C}_{60} \mathrm{Me}_{5}^{-}\left(\mathbf{A}^{-}\right)$. After the
reduction, the anion $\mathbf{A}^{-}$was oxidized to radical $\mathbf{A}^{\bullet}$ and recombined with radicals $\mathrm{Cl}^{\bullet}$ or $\mathrm{Br}^{\bullet}$ to form $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Cl}(\mathbf{2 8 b})$ and $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}(\mathbf{2 8 c})$ again (Scheme 3). These results are similar to the reduction of $\mathrm{C}_{60} \mathrm{Ph}_{5} \mathrm{Cl}^{78}$ Reduction potentials of $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Cl}(\mathbf{2 8 b})$ and $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}(\mathbf{2 8 c})$ are -1.35 and -1.14 V , the values of which are larger than that of $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{H}\left(E_{1 / 2}=-1.48 \mathrm{~V}\right) .{ }^{17} \mathrm{c}$ This result shows that halide anions can be removed easily from fullerene core.

Figure 23. Cyclic voltammograms of chloride $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Cl}$ (28b) (a) and bromide $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}(\mathbf{2 8 c})(\mathrm{b})\left(0.10 \mathrm{M}\left[\mathrm{Bu}_{4} \mathrm{~N}\right]\left[\mathrm{ClO}_{4}\right]\right.$ in THF, 1.0 mM , glassy carbon working electrode, $0.10 \mathrm{~V} / \mathrm{s}, 25^{\circ} \mathrm{C}$ ).

Scheme 3. Proposed mechanism of redox behavior of $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Cl}$ (28b) and $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c).

## 4-4. Synthesis of Fullerene-Transition Metal Complexes

By the reactions of the fullerene bromide $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c) with some low valent transition metal species, we succeeded in the syntheses of fullerene-transition metal complexes (eq 12-14). Rhenium tricarbonyl complex $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{3}$ (31) was obtained by the reaction of fullerene bromide $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c) with ate-type rhenium complex $\mathrm{Na}\left[\operatorname{Re}(\mathrm{CO})_{5}\right]$ (eq 12). The fullerene bromide $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c) was consumed completely after this reaction. APCI-MS spectrum indicated the formation of rhenium complex $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{3}(31)$. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra showed $C_{5 v}$ symmetry of the MeFCp moiety. In the ${ }^{13} \mathrm{C}$ NMR spectrum, only one signal assigned to
carbonyl groups was observed. The IR spectrum showed that there are two absorptions at 2022 and $1932 \mathrm{~cm}^{-1}$, which correspond to stretching vibrations of three carbonyl groups $\left[\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Bn}_{2} \mathrm{PhH}_{2}\right)(\mathrm{CO})_{3}{ }^{22}: 2024,1939 \mathrm{~cm}^{-1} ; \operatorname{ReCp}(\mathrm{CO})_{3}{ }^{81}\right.$ : 2019, $1897 \mathrm{~cm}^{-1} ; \operatorname{Re}\left(\eta^{5}-\mathrm{C}_{20} \mathrm{H}_{17}\right)(\mathrm{CO})_{3} \quad\left(\mathrm{C}_{20} \mathrm{H}_{17}=\right.$ partially hydrogenated coranulene) ${ }^{82}$ : 2009, $1896 \mathrm{~cm}^{-1}$. These bond strengths of carbonyl groups are reflected by the electron withdrawing or donating nature of the MeFCp or Cp or $\mathrm{C}_{20} \mathrm{H}_{17}$ ligands. These results showed that three carbonyl groups are equal and coordinate to rhenium center as a piano-stool shape.

28c

31
10 \%

Next, I examined to synthesize iron bromodicarbonyl complex $\mathrm{FeBr}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (32). The oxidative addition of the fullerene bromide $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c) with $\mathrm{Fe}(\mathrm{CO})_{5}$ in 1,2-dichlorobenzene at $25{ }^{\circ} \mathrm{C}$ to give $\mathrm{FeBr}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (32) in $95 \%$ yield (eq 13). The iron carbonyl complex

[^35]$\mathrm{FeBr}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (32) in solution is sensitive to air and light and decomposes to $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{H}$ and its oxidation products. The chemical shifts of the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of iron complex $\mathrm{FeBr}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (32) are comparable to those of ruthenium halodicarbonyl complexes $\operatorname{RuCl}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}{ }^{24}$ and $\operatorname{RuBr}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}{ }^{25}$ (eq 13). This observation strongly supports the formation of $\operatorname{FeBr}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (32). In the IR spectrum, two absorption signals, which were assigned to symmetric and asymmetric stretching vibrations of carbonyl groups, were observed at 2037 and $1996 \mathrm{~cm}^{-1}\left(\mathrm{FeBrCp}(\mathrm{CO}) 2^{83}: 2048,2002 \mathrm{~cm}^{-1}\right)$.

The reaction of the fullerene bromide $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c) with cobalt complex $\mathrm{Na}\left[\mathrm{Co}(\mathrm{CO})_{4}\right]$ gave cobalt dicarbonyl complex $\mathrm{Co}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (33) (eq 14). In this reaction, $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{H}$ was formed as a side product. Since the cobalt complex $\mathrm{Co}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (33) was very sensitive to air, we could not

[^36]succeeded in the isolation of this complex. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra show that MeFCp moiety of cobalt complex $\mathrm{Co}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (33) has $\mathrm{C}_{5 v}$ symmetry. The chemical sifts of cobalt complex $\mathrm{Co}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (33) are similar to those of rhodium dicarbonyl complex $\mathrm{Rh}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO}) 2_{2}{ }^{26}$ In the FAB-MS spectrum, molecular ion signal $(m / z=910)$ of cobalt complex $\mathrm{Co}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (33) was observed. These results support the formation of $\mathrm{Co}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathbf{3 3})$.

28c

33

The proposed formation mechanisms of these fullerene-transition metal complexes $\quad \operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{3} \quad$ (31), $\quad \operatorname{FeBr}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2} \quad$ (32) and $\mathrm{Co}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (33) are as follows. The bromide ion comes apart from fullerene bromide $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c), followed by the single electron transfer from low valent transition metal complexes to fullerene bromide $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c). The radical $\mathrm{C}_{60} \mathrm{Me}_{5}{ }^{\circ}$ or anion $\mathrm{C}_{60} \mathrm{Me}_{5}{ }^{-}$, and bromide ion combine with transition metal species to give fullerene-transition metal complexes $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{3}$
(31), $\mathrm{FeBr}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (32) and $\mathrm{Co}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (33).

## 4-5. X-ray Crystal Structure Analysis of Rhenium Complex

The red single crystals suitable for X-ray diffraction were obtained by recrystalization from $\mathrm{CS}_{2} /$ ethanol. The conclusive structure of rhenium complex $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{6} \mathrm{Me}_{5}\right)(\mathrm{CO})_{3}$ (31) was determined by X-ray analysis (Figure 24). The MeFCp ligand coordinates to rhenium atom in an $\eta^{5}$ fashion. The averaged bond length of five $\operatorname{Re}-\mathrm{C}(\mathrm{FCp})$ bonds is $2.327(11) \AA$, which is similar to those of $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Bn}_{2} \mathrm{PhH}_{2}\right)(\mathrm{CO})_{3}^{22}(2.334(8) \AA)$ and $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{20} \mathrm{H}_{17}\right)(\mathrm{CO}) 3^{82}(2.340(5) \AA)$. The averaged bond lengths of $\operatorname{Re}-\mathrm{C}(\mathrm{CO})(1.911(18) \AA$ ) and $\mathrm{C}(\mathrm{CO})-\mathrm{O}(\mathrm{CO})$ $(1.159(19) \AA)$ are almost the same as those of $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Bn}_{2} \mathrm{PhH}_{2}\right)(\mathrm{CO})_{3}{ }^{22}$ (1.909(12) and 1.165(15) $\AA$ ) and $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{20} \mathrm{H}_{17}\right)(\mathrm{CO})_{3}{ }^{82}(1.907(7)$ and 1.154(9) $\AA)$.

Figure 24. Molecular structure of rhenium tricarbonyl complex $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{3}(31)$ with $30 \%$ probability level ellipsoids. The $\mathrm{CS}_{2}$ molecule in the unit cell is omitted for clarity.

## 4-6. Electrochemical Measurement of Rhenium Complex

To elucidate the electrochemical properties of the rhenium tricarbonyl complex $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{3} \quad(31)$, electrochemical measurements were performed (Figure 25). Complex $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{3}(31)$ could not be oxidized, but could be reduced reversibly in two step-one electron reductions. Since these reduction potentials are -1.33 and -1.94 V , which are similar to those of fullerene transition metal complexes, ${ }^{23,24,25,26}$ the reductions must occur in the $50 \pi$ electron system of $\mathrm{C}_{60}$.

Figure 25. Cyclic voltammogram of rhenium complex $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{3}(31)$.

## 4-7. Derivatization of Iron Chlorodicarbonyl Complex

The iron dicarbonyl complex $\mathrm{FeBr}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(32)$ could be derivatized into bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{5}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathbf{1 1})^{23}$ by the method similar to synthesize bucky ruthenocene $\mathrm{Ru}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{5}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)^{24}$ (Scheme 4) (in collaboration with Ms. Ayako Muramatsu). The iron complex $\mathrm{FeBr}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (32) could also be derivatized into $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2} \mathrm{Me}$ (34), $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCH})(35)$ and $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCPh})(36)$ by the similar method of the syntheses of $\mathrm{FeCp}(\mathrm{CO})_{2} \mathrm{R}^{84}$ or $\mathrm{Ru}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2} \mathrm{R}^{24}$ (Scheme 4).

[^37]Scheme 4. Derivatization of $\operatorname{FeBr}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (32) into some iron complexes.

The complex $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{5}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)$ (11) could be assigned as bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{5}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)$ because the chemical shifts of the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{5}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)$ (11) are the same as those of bucky ferrocene $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{5}\right)\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right) .{ }^{23}$ The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR and IR spectra of iron complex $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2} \mathrm{Me}$ (34), $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCH}) \quad$ (35) and $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCPh})(36)$, were similar to those of the corresponding ruthenium complexes $\mathrm{Ru}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2} \mathrm{Me}, \mathrm{Ru}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCH})$ and $\mathrm{Ru}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCPh}) .{ }^{24}$ The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR of $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2} \mathrm{Me}$ (34), $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCH}) \quad$ (35) and $\quad \mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCPh})$ indicated that MeFCp moieties of these iron complexes have $C_{5 v}$ symmetry. This results show that the rotation rates of MeFCp moieties around the Fe-MeFCp axis are faster than the relaxation time of NMR spectra. Carbon signal due to methyl group of $\mathrm{Fe}(\mathrm{Me})\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ (34) was observed at -20.82 ppm ,
which is similar to that of $\operatorname{FeCp}(\mathrm{CO})_{2} \mathrm{Me}(-23.5 \mathrm{ppm}) .{ }^{84}$ IR spectra of $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2} \mathrm{Me} \quad(34), \quad \mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCH}) \quad$ (35) and $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCPh})$ (36) showed two signals, which are assigned to stretching vibrations of carbonyl groups, at 2004, $1953 \mathrm{~cm}^{-1}$ $\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2} \mathrm{Me}(34)\right], 2035,1991 \mathrm{~cm}^{-1}\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCH})(35)\right]$ and 2035, $1990 \mathrm{~cm}^{-1}\left[\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCPh})(36)\right]$. These wave numbers are similar to those of the corresponding iron carbonyl complexes $\mathrm{FeCp}(\mathrm{CO})_{2} \mathrm{Me}^{84}$ $\left(2010,1955 \mathrm{~cm}^{-1}\right), \mathrm{FeCp}(\mathrm{CO})_{2}(\mathrm{CCH})^{85}\left(2050,1998 \mathrm{~cm}^{-1}\right)$ and $\mathrm{FeCp}(\mathrm{CO})_{2}(\mathrm{CCPh})^{86}$ (2045, $2000 \mathrm{~cm}^{-1}$ ). The stretching vibrations of phenylethynyl complex $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCPh})(36)$ were observed at $2107(\mathrm{CC}), 2035$ and $1990 \mathrm{~cm}^{-1}$ (CO), which are higher wave numbers than those of the corresponding phenylethynyl complex $\mathrm{FeCp}^{*}(\mathrm{CO})_{2}(\mathrm{CCPh})\left(\mathrm{CC}: 2094 \mathrm{~cm}^{-1}\right.$; CO: 2006, 1966 $\left.\mathrm{cm}^{-1}\right) .{ }^{86}$ These observations reflect the electron withdrawing nature of the MeFCp ligand.

While $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2} \mathrm{Me}$ (34), $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCH})$ (35) and $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCPh}) \quad$ (36) are unstable in degassed solution, ${ }^{87}$ $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2} \mathrm{Me} \quad(34), \quad \mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCH}) \quad$ (35) and $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCPh})$ (36) did not decompose under shading condition even in air or water for a few days. These results indicate that

[^38]$\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2} \mathrm{Me}$
(34), $\quad \mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCH})$
and $\mathrm{Fe}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}(\mathrm{CCPh})$ (36) are sensitive to light and decompose into $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{H}$.

## 4-8. Conclusion

I succeeded in the syntheses of fullerene halides $\operatorname{RFCpX}(R=M e, ~ P h ; ~ X=F$, $\mathrm{Cl}, \mathrm{Br}, \mathrm{I})$ by the reaction of $\mathrm{C}_{60} \mathrm{R}_{5} \mathrm{~K}$ with halogenation reagents. The reactions between fullerene halides and low valent transition metal compounds gave fullerene-rhenium, iron and cobalt complexes, $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{3}$, $\mathrm{FeBr}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2} \quad$ and $\quad \mathrm{Co}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2} . \quad \mathrm{I} \quad$ could derivatize $\mathrm{FeBr}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{2}$ into some iron complexes. The synthetic methods not only transmetalation or the reactions via C-H activation or hydrometallation reaction but also the reactions between fullerene halides and transition metal compounds are expected to give many kinds of fullerene-transition metal complexes. These complexes will bring wide varieties of development of fullerene-organometallic chemistry, $88,89,90,91$ catalytic reactions $92,93,94$ and

materials science.

## 4-9. Experimental

General Procedure. All manipulations were carried out under nitrogen or argon atmosphere using standard Schlenk techniques. THF was distilled from $\mathrm{Na} / \mathrm{K}$ alloy and thoroughly degassed by trap-to-trap distillation. Benzene was distilled from calcium hydride. $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{H}$ and $\mathrm{C}_{60} \mathrm{Ph}_{5} \mathrm{H}$ were prepared according to the literature. ${ }^{17}$ THF solution of $t-\mathrm{BuOK}, \mathrm{MeLi}, \mathrm{HCCMgBr}$ and PhCCMgBr were purchased from Sigma-Aldrich Co. and used as received. N -Fluoropyridinium triflate, N -Chlorosuccinimide, N -Bromosuccinimide and $N$-Iodosuccinimide were purchased from Tokyo Kasei Co. and were recrystallized from benzene.

Preparative HPLC separations were performed by use of Bucky Prep. column (Nakalai Tesque Co., $20 \mathrm{~mm} \times 250 \mathrm{~mm}$ ).
${ }^{1} \mathrm{H}(400 \mathrm{MHz})$ and ${ }^{13} \mathrm{C}(100 \mathrm{MHz})$ NMR spectra were recorded using JEOL EX-400 spectrometer. Proton chemical shifts are reported relative to $\mathrm{Me}_{4} \mathrm{Si}$

$\left(\mathrm{CDCl}_{3}\right)$ at $\delta 0.00 \mathrm{ppm}$ or residual solvent peaks $\left(\mathrm{CDCl}_{3}\right.$ at $\delta 7.26 \mathrm{ppm} ; \mathrm{THF}-d_{8}$ at $\delta 1.73$ and 3.58 ppm$)$. Carbon chemical shifts are reported relative to $\mathrm{CDCl}_{3}$ at $\delta$ 77.00 ppm or THF- $d_{8}$ at $\delta 25.20$ and 67.40 ppm . Other spectra were recorded on the following instruments: IR, JASCO IR-420 and ReactIR 1000; UV/vis spectra, HITACHI U3500 and Shimadzu SPD-6A; Mass spectra, Shimadzu LCMS-QP8000 and JEOL Accu TOF (JMS-T100LC). Elemental Analyses were performed at organic elemental analysis laboratory in this department.
$\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{~F}$ (28a). To a suspension of $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{H}(202 \mathrm{mg}, 251 \mu \mathrm{~mol})$ in THF (10.0 $\mathrm{mL})$ was added a solution of ${ }^{t} \mathrm{BuOK}(1.0 \mathrm{M}, 0.28 \mathrm{~mL}, 280 \mu \mathrm{~mol})$ in THF. After stirring for $1.5 \mathrm{~h}, \mathrm{~N}$-fluoropyridinium triflate $(93.1 \mathrm{mg}, 377 \mu \mathrm{~mol})$ was added. The mixture was stirred for 0.5 h . After dilution with toluene, the mixture was washed with water. The organic phase was concentrated in vacuo. After preparative HPLC separation [Bucky Prep. (Nacalai Tesque Co., $20 \mathrm{~mm} \times 250$ $\mathrm{mm})$, toluene $/ 2$-propanol $=7 / 3$, flow rate $=18 \mathrm{~mL} / \mathrm{min}$, retention time $=7.5-$ $9.0 \mathrm{~min}]$ )] afforded $\mathrm{C}_{6} \mathrm{Me}_{5} \mathrm{~F}$ (28a) (37.9 mg, 19\% yield) and $\mathrm{C}_{60} \mathrm{Me}_{5}(2-\mathrm{pyridyl})$ (30) (32.2 mg, 15\%) as air stable reddish orange solids. $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{~F}$ (28a): ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 2.24(\mathrm{~s}, 6 \mathrm{H}), 2.34(\mathrm{~s}, 6 \mathrm{H}), 2.36(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{1} \mathrm{H}$ NMR (400 MHz, $\mathrm{CDCl}_{3} / \mathrm{CS}_{2}$ ) $\delta 2.21(\mathrm{~s}, 6 \mathrm{H}), 2.29(\mathrm{~s}, 3 \mathrm{H}), 2.32(\mathrm{~s}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100 MHz , $\left.\mathrm{CDCl}_{3} / \mathrm{CS}_{2}\right) \delta 24.97\left(\mathrm{~d}, \mathrm{~J}_{\mathrm{F}-\mathrm{C}}=1.7 \mathrm{~Hz}, 2 \mathrm{C}, \mathrm{C}(\mathrm{Me})\right), 26.37\left(\mathrm{~d}, J_{\mathrm{F}-\mathrm{C}}=1.7 \mathrm{~Hz}, 2 \mathrm{C}\right.$, $\mathrm{C}(\mathrm{Me}))$, $26.57\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{F}-\mathrm{C}}=19.0 \mathrm{~Hz}, 1 \mathrm{C}, \mathrm{C}(\mathrm{Me})\right), 50.27\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{F}-\mathrm{C}}=1.7 \mathrm{~Hz}, 2 \mathrm{C}, \mathrm{C}(\alpha)\right)$, $51.61(2 \mathrm{C}, \mathrm{C}(\alpha)), 53.49\left(\mathrm{~d},{ }^{2} \mathrm{~J}_{\mathrm{F}-\mathrm{C}}=27.3 \mathrm{~Hz}, 1 \mathrm{C}, \mathrm{C}(\alpha)\right), 82.18\left(\mathrm{~d},{ }^{1} \mathrm{~J}_{\mathrm{F}-\mathrm{C}}=338 \mathrm{~Hz}, 1 \mathrm{C}\right.$,

$\operatorname{FeBr}\left(\boldsymbol{\eta}^{\mathbf{5}} \mathbf{- M e F C p}\right)(\mathrm{CO})_{2} \mathbf{( 3 2 )}$. To a suspension of $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}(\mathbf{2 8 c})(660 \mathrm{mg}, 754$ $\mu \mathrm{mol})$ in 1,2-dichlorobenzene ( 11.0 mL ) was added $\mathrm{Fe}(\mathrm{CO})_{5}(500 \mu \mathrm{~L}, 3.80 \mathrm{mmol})$. After stirring for 17 h at $25^{\circ} \mathrm{C}$, dark orange precipitate was formed. Degassed hexane ( 40 mL ) was added to a reaction mixture, then the precipitate was filtered and washed with hexane. After the solid was dried under reduced pressure, $\operatorname{FeBr}\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2}$ (32) (707 mg, 95\%) was obtained as reddish orange solid. $\operatorname{FeBr}\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2}$ (32): ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ) $\delta 2.23$ (s, $15 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ) $\delta 28.70$ (5C, C(Me)), 51.11 (5C, C( $\alpha$ )), 105.89 (5C, C(Cp)), 143.62 (10C), 144.10 (10C), 147.38 (5C), 148.59 (10C), 148.86 (5C), 152.33 (10C), 214.06 (2C, $\mathrm{C}(\mathrm{CO})): \quad \mathrm{IR}\left(\mathrm{KBr}, \quad v / \mathrm{cm}^{-1}\right)$ 2037, 1996; UV-vis (toluene/2-propanol $=7 / 3$ ) $\lambda_{\max }$ 288, 336 (shoulder), 356 (shoulder), 394, 466 (shoulder) nm.
$\mathbf{C o}\left(\boldsymbol{\eta}^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2}$ (33). To a solution of $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c) (20.1 mg, 23.0 $\mu \mathrm{mol})$ in THF $(5.0 \mathrm{~mL}), \mathrm{Na}\left[\mathrm{Co}(\mathrm{CO})_{4}\right](4.45 \mathrm{mg}, 22.9 \mu \mathrm{~mol})$ in THF $(0.97 \mathrm{~mL})$ was added. After the mixture was stirred for 1 h , the solvent was removed in vacuo. $\mathrm{Co}\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2}(33):{ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz}, \mathrm{THF}-d_{8}\right) \delta 2.43(\mathrm{~s}, 15 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{THF}-d_{8}$ ) $\delta 32.78$ (5C, Me), 51.25 (5C, C( $\alpha$ )), 108.90 (5C, C(Cp)), 144.32
(5C), 145.23 (10C), 145.36 (10C), 147.54 (10C), 148.71 (10C), 154.11 (5C), [Carbonyl (2C) signal could not be detected because of the low solubility of 33]; FAB-MS (+) $m / z=910\left(\mathrm{M}^{+}\right)$.
$\mathrm{Fe}\left(\boldsymbol{\eta}^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2} \mathbf{M e}$ (34). To a solution of $\mathrm{FeBr}\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2}$ (32) ( $47.6 \mathrm{mg}, 48.1 \mu \mathrm{~mol}$ ) in benzene ( 8.4 mL ) was added 1.14 M solution of MeLi in ether ( $84.5 \mathrm{~mL}, 96.2 \mu \mathrm{~mol}$ ) at $25^{\circ} \mathrm{C}$. After stirring for 10 min , the reaction mixture was passed through a pad of silica gel and was concentrated in vacuo (ca. 5 mL ). By the addition of methanol into the mixture, iron-methyl complex $\mathrm{Fe}\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2} \mathrm{Me}(34)(22.3 \mathrm{mg}, 50 \%)$ was obtained as orange solid. MeMgBr in THF also gave $\mathrm{Fe}\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2} \mathrm{Me}(34) . \mathrm{Fe}\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2} \mathrm{Me}$ (34): ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ) $\delta 0.99(\mathrm{~s}, 3 \mathrm{H}), 2.10(\mathrm{~s}, 15 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100 MHz , $\left.\mathrm{C}_{6} \mathrm{D}_{6}\right) \delta-20.83(1 \mathrm{C}, \mathrm{Fe}-\mathrm{Me}), 28.18$ (5C, $\mathrm{C}(\mathrm{Me})$ ), 50.95 (5C, $\mathrm{C}(\alpha)$ ), 106.59 (5C, $C(C p)), 144.04$ (10C), 144.22 (10C), 147.39 (5C), 148.55 (10C), 148.93 (5C), 153.11 (10C), 218.13 (2C, C(CO)): IR (KBr, v/cm ${ }^{-1}$ ) 2004, 1953.
$\left.\mathbf{F e}\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2} \mathbf{( C C H}\right)(\mathbf{3 5})$. To a solution of $\mathrm{FeBr}\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2}(\mathbf{3 2 )}$ ( $108 \mathrm{mg}, 110 \mu \mathrm{~mol}$ ) in benzene ( 19.2 mL ) was added 0.95 M solution of HCCMgBr in THF $(217 \mu \mathrm{~L}, 206 \mu \mathrm{~mol})$ at $25^{\circ} \mathrm{C}$. After stirring for 10 min , the reaction mixture was passed through a pad of silica gel and was concentrated in vacuo (ca. 10 mL ). By the addition of methanol into the mixture, iron-ethynyl complex $\mathrm{Fe}\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2}(\mathrm{CCH})(35)(74.3 \mathrm{mg}, 71 \%)$ was obtained as orange
microcrystals. $\mathrm{Fe}\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2}(\mathrm{CCH})(35):{ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}\right) \delta 1.72$ (s, 1H), $2.34(\mathrm{~s}, 15 \mathrm{H}) ;{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{THF}-d_{8} / \mathrm{CS}_{2}=1 / 1$ ) $\delta 1.80(\mathrm{~s}, 1 \mathrm{H}), 2.57$ (s, 15H); ${ }^{13} \mathrm{C}$ NMR (100 MHz, $\mathrm{C}_{6} \mathrm{D}_{6}$ ) $\delta 28.72$ (5C, C(Me)), 50.72 (5C, C( $\alpha$ )), 107.02 (5C, C(Cp)), 107.76 (1C, CCH), 128.80 (1C, CCH), 143.99 (10C), 144.12 (10C), 147.39 (5C), 148.59 (10C), 148.93 (5C), 152.79 (10C), 213.66 (2C, C(CO)).
$\mathbf{F e}\left(\boldsymbol{\eta}^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2}(\mathbf{C C P h})(\mathbf{3 6})$. To a solution of $\mathrm{FeBr}\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2}(\mathbf{3 2 )}$ ( $102 \mathrm{mg}, 103 \mu \mathrm{~mol}$ ) in benzene ( 18.0 mL ) was added 0.95 M solution of PhCCMgBr in THF $(217 \mu \mathrm{~L}, 206 \mu \mathrm{~mol})$ at $25^{\circ} \mathrm{C}$. After stirring for 10 min , the reaction mixture was passed through a pad of silica gel and was concentrated in vacuo (ca. 10 mL ). Methanol was added to the mixture, iron-phenylethynyl complex $\mathrm{Fe}\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2}(\mathrm{CCPh})(36)(55.8 \mathrm{mg}, 54 \%)$ was obtained as orange microcrystals. $\mathrm{Fe}\left(\eta^{5}-\mathrm{MeFCp}\right)(\mathrm{CO})_{2}(\mathrm{CCPh})(36):{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}\right) \delta 2.25$ (s, 15H), $7.34(\mathrm{~m}, 5 \mathrm{H}, \mathrm{Ph}), 7.67(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Ph}) ;{ }^{95}{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{THF}-d_{8} / \mathrm{CS}_{2}$ $=1 / 1) \delta 2.60(\mathrm{~s}, 15 \mathrm{H}), 7.10(\mathrm{~m}, 5 \mathrm{H}, \mathrm{Ph}), 7.21(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Ph}), 7.33(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Ph}) ;{ }^{13} \mathrm{C}$ NMR (100 MHz, THF- $\left.d_{8} / \mathrm{CS}_{2}=1 / 1\right) \delta 28.73$ (5C, C(Me)), 50.74 (5C, C( $\alpha$ )), 82.98 (1C, CCPh), 107.24 (5C, C(Cp)), 126.18 (5C, Ph), 128.58 (10C), 128.84 (5C), 128.95 (1C, CCPh), 131.69 (10C, Ph), 144.34 (10C), 144.36 (10C), 147.54 (5C), 148.74 (10C), 149.04 (5C), 153.25 (10C), 213.37 (2C, C(CO)); IR ( $\mathrm{KBr}, ~ v / \mathrm{cm}^{-1}$ ) 2035, 1991.

[^39]X-ray Diffraction. Crystals of $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}(\mathbf{2 8 c})$ and $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{3}$ (31) suitable for the X-ray diffraction study were mounted on a MacScience DIP2030 Imaging Plate diffractometer for data collection using MoK $\alpha$ (graphite monochromated, $\lambda=0.71069 \AA$ ) radiation. Crystal data and data statistics are summarized in Table 9. The structure of the complex $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c) and $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{3}(\mathbf{3 1})$ were solved by the directed method (SHELXS-97) ${ }^{43}$ and expanded using Fourier techniques (DIRDIF-94). ${ }^{44}$ The positional parameter and thermal parameters of non-hydrogen atoms of $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c) and $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{3}$ (31) were refined using a full-matrix least square method. Hydrogen atoms were placed at calculated positions $(\mathrm{C}-\mathrm{H}=0.95 \AA$ ) and kept fixed. All non-hydrogen atoms of $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}(\mathbf{2 8 c})$ and $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{3}(\mathbf{3 1})$ were anisotropically refined. In the subsequent refinement, the function $\Sigma \omega\left(F_{\mathrm{o}^{2}}{ }^{2}\right.$ $\left.F_{\mathrm{c}}{ }^{2}\right)^{2}$ was minimized, where $\left|F_{\mathrm{o}}\right|$ and $\left|F_{\mathrm{c}}\right|$ are the observed and calculated structure factor amplitudes, respectively. The agreement indices are defined as $R 1=\Sigma\left(| | F_{\mathrm{o}}\left|-\left|F_{\mathrm{c}}\right|\right|\right) / \Sigma\left|F_{\mathrm{o}}\right|$ and $\mathrm{w} R 2=\left[\Sigma \omega\left(F_{\mathrm{o}}^{2}-F_{\mathrm{c}}^{2}\right)^{2} / \Sigma\left(\omega F_{\mathrm{o}}{ }^{4}\right)\right]^{1 / 2}$.

We could put three points as to bromo atom in $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}(28 \mathrm{c})$ because of its disorder. Each ratios of the existences are 52,24 and $12 \%$. The bond length between bromo atom ( $52 \%$ ) and carbon atom of $\mathrm{C}_{60} \mathrm{Me}_{5}$ moiety is $2.12 \AA$. However, these data have low confidence because of the disorder of bromo atom.

Table 9. Crystal Data and Structure Analysis Results for Complexes $\mathrm{C}_{60} \mathrm{Me}_{5} \mathrm{Br}$ (28c) and $\operatorname{Re}\left(\eta^{5}-\mathrm{C}_{60} \mathrm{Me}_{5}\right)(\mathrm{CO})_{3}$ (31).

Electrochemical Measurements. Electrochemical measurements were performed using a BAS CV-50W voltammetric analyzer. A glassy carbon electrode was used as the working electrode. The counter electrode was a platinum coil, and reference electrode was a $\mathrm{Ag} / \mathrm{Ag}^{+}$electrode. Cyclic voltammetry (CV) was performed at a scan rate of $100 \mathrm{mV} / \mathrm{s}$. All half wave potentials $E_{1 / 2}=\left(E_{\mathrm{pc}}+E_{\mathrm{pa}}\right) / 2$, where $E_{\mathrm{pc}}$ and $E_{\mathrm{pa}}$ are the cathodic and anodic peak potentials, respectively. The potential was corrected against $\mathrm{Fc} / \mathrm{Fc}^{+}$.

## Chapter 5 Conclusion

For the development of functional materials based on fullerenes, I studied the synthesis, structure and properties of fullerene cyclopentadienyl-transition metal complexes.

In Chapter 2, I reported the synthesis of $\pi$-allyl nickel, palladium and platinum complexes. In particular, the results that $\pi$-allyl nickel complexes are stable to air are opposite to the fact that low valent nickel complexes are sensitive to air. These results are specific in $\mathrm{C}_{6} \mathrm{Ph}_{5}$-nickel complexes than $\mathrm{C}_{60} \mathrm{Me}_{5}$ ones. This result indicated that fullerene ligands $\mathrm{C}_{6} \mathrm{R}_{5}$ have a steric protection effect owing to the steric environment made by five substituents..

In Chapter 3, I reported the synthesis of bucky ferrocenes, which are hybrid molecules of ferrocene and fullerene. As the discovery of ferrocene brought wide variety of development of organometallic chemistry, it is expected that the discovery of bucky ferrrocenes will bring development of organometallic chemistry of fullerene. Bucky ferrocenes are very stable to heat, light, water and dioxigen like ferrocene $\mathrm{FeCp}_{2}$. Cyclic voltammetry showed that bucky ferrocenes show a reversible oxidation and reduction behavior like ferrocene and fullerene, and there is electron communication between the ferrocene and the fullerene parts, which was also supported by the theoretical calculations. These results may bring the new properties, for example, redox active nano-devices. The ${ }^{1} \mathrm{H}$ NMR spectra of bucky ferrocenes showed that Cp ligands
of bucky ferrocenes have aromatic nature like that of ferrocene. Thus Friedel-Crafts acylation of bucky ferrocene gave corresponding acyl bucky ferrocenes. With appropriate functionalizations, bucky ferrocene could be used as building blocks of functional molecules.

In Chapter 4, I reported the syntheses of pentasubstituted fullerene halides, and rhenium, iron and cobalt fullerene complexes by the reaction of fullerene bromide with low valent transition metal complexes. As a result, many kinds of penta-substituted fullerene-transition metal complexes could be synthesized not only by transmetalation or reactions via C-H bond activation, but also by the reaction between fullerene halides and low valent transition metal complexes.

Based on the data reported in this thesis, it is expected that fullerene-transition metal complexes and their substituted derivatives could be utilized for catalysts and functional materials in the future.

[^7]:    ${ }^{27}$ In our reexamination of the synthesis and properties of $\mathrm{Ni}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{Cp}\right)$, this complex is very stable to water, reacted with air (probably, $\mathrm{O}_{2}$ ) to give light yellow solid. This solid seems to be $\mathrm{Ni}(\mathrm{I})$ or $\mathrm{Ni}(\mathrm{II})$ salt. Since the molecular ion peak of allylcyclopentadiene was detected by GC-MS measurements, decomposed mechanisms of $\mathrm{Ni}\left(\eta^{3}\right.$-allyl $)\left(\eta^{5}-\mathrm{Cp}\right)$ are oxidation of nickel atom and reductive elimination of allylcyclopentadiene.
