**Study on the mechanism of recruitment variations of small
pelagic fish populations (GLOBEC)**

By

The Scientific Members of the Cruise

Edited by

Takashige SUGIMOTO

PREFACE

Warm water tongues and streamers derived from the Kuroshio and the Kuroshio Extension influence larval transport process and larval growth-survival process for pelagic fish such as sardine and jack mackerel which have spawn grounds in the Kuroshio region. In particular, these physical and biological processes are an important factor to determine abundance of recruitment of the pelagic fish. In this cruise, meso-scale temporal fluctuations in their distribution were intensively observed. This observation will provide good data for studies on function of larval transport and changes in distribution of larval fish, their prey, nutrients and chlorophyll, which would be related to growth and survival of fishery-important fish species.

The main observation in this cruise were focused on the Enshu-nada and Kashima-nada Seas where were the regions of the Kuroshio, the Kuroshio Extension and the Kuroshio – Oyashio transition, and conducted with CTD, satellite data acquisition, surface biological environment monitoring system, ADCP, floating buoy tracking system and net towing (ORI, MTD, IKMT, mid-layer trawl, NORPAC).

Followings are main research conducted in this research cruise.

1. Current field observation with ADCP
2. Moving and changing process of water mass property using floating buoys
3. Primary and secondary production in warm core rings
4. Ecology of zooplankton and micro-nekton
5. Catch of larvae and adults by nets and mid-trawl net
6. Catch of sardine and anchovy by gill net
7. Mud sampling with piston core
8. Studies on air property

We had very good weather condition and enthusiastic cooperation by ship crews. Most of the scheduled observation had been completed. We would like to express our deep appreciation to the crews.

Takashige Sugimoto
Chief Scientist
