1. On the Cruises KH-91-5 and KH-93-2 of the R.V. Hakuho Maru

Deep waters to fill the North Pacific Ocean come from the southern hemisphere across the meridian of 165°E. Two cruises of the R.V. Hakuho Maru were carried out in 1991 (13 August – 2 October, KH-91-5) and in 1993 (13 May – 18 June, KH-93-2) along 165°E from 48°N to 5°S.

Main purpose of the cruises is to collect temperature, salinity and dissolved oxygen data at the full depth. A model of the NBIS CTD, Mark IIIb, was used for the cruise in 1991. Calibration tests for temperature and pressure sensors were made at the Ocean Research Institute. A model of the SBE CTD, model 11-plus, was used for the cruise in 1993, and the calibration was made by the SBE. Intercomparison was made in both cruises by using sampled water collected with a Rosette Multi-bottle sampler. The CTD data are processed by Prof. Masaki Kawabe. Chemical properties of the sampled water were examined by Dr. Shuichi Watanabe. The hydrographic survey is planned to meet requirements of the World Ocean Circulation Experiment Hydrographic Programme on the WHP-P13 along 165°E. Current measurements were made by using 5 mooring lines which were set in KH-91-5 and recovered in KH-93-5, and by using sofar floats.

Hydrographic studies are made on the formation and distribution of the subtropical mode water in the east to Honshu during the cruise of KH-93-2. Prof. Kimio Hanawa is responsible for the data. A surface buoy and three subsurface moorings were deployed in the study area, and Prof. Keisuke Taira is responsible for the moorings.

Two scientists from China and Thailand participated in the cruises sponsored by the Unesco-IOC Westpac Programme.

The hydrographic data are already submitted to the Japan Oceanographic Data Center for the cooperative research.

Keisuke Taira, Chief Scientist

2. List of Scientists Aboard

Scientists aboard the KH-91-5 Cruise

TAIRA, Keisuke	Ocean Research Institute, University of Tokyo
KAWABE, Masaki	Ocean Research Institute, University of Tokyo
UEHARA, Katsuto	Ocean Research Institute, University of Tokyo
KITAGAWA, Shoji	Ocean Research Institute, University of Tokyo
MIZUTA, Genta	Ocean Research Institute, University of Tokyo
YANAGIMOTO, Daigo	Ocean Research Institute, University of Tokyo
NAMBU, Masami	Ocean Research Institute, University of Tokyo

5. Summary of observation stations

STNNBR: Station number C=CTD, X=XBT
 TYPE: CTD=CTDO only, ROS=CTDO plus Rosette water sampler
 MOR=Mooring, XBT=XBT, FLT=Float
 CODE: BE=Beginning of cast, BO=Bottom time for cast, EN=Time cast completed
 DE=Time mooring, float, or XBT was deployed, RE=Time mooring was recovered
 BOTDEP: Bottom depth in meters
 MAXPRS: Maximum pressure in decibars

KH9105 Leg 1

6. Mooring Systems

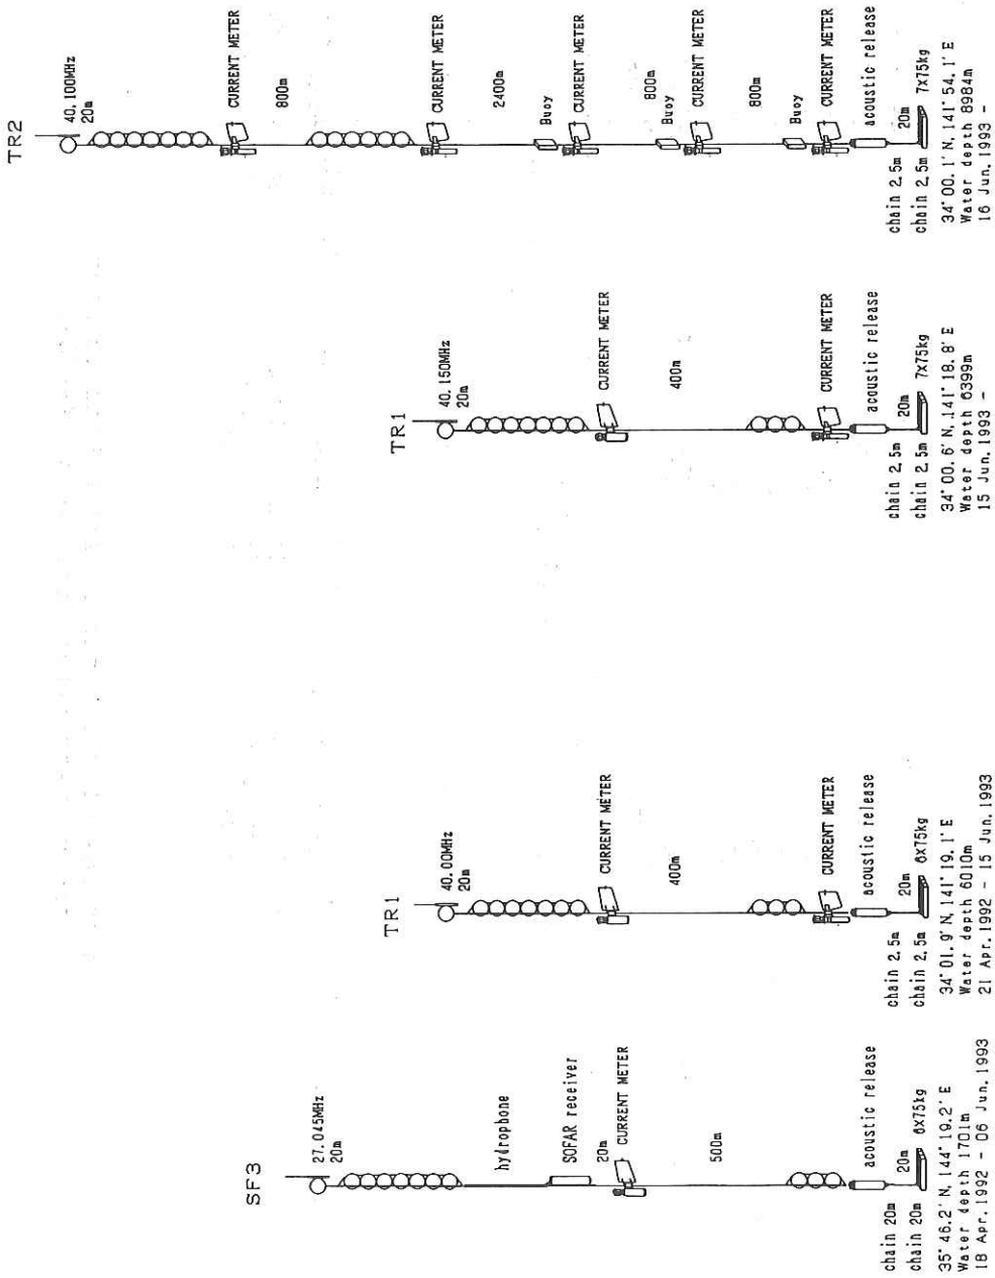

Moorings of current meter and SOFAR-float receiver recovered (left) and deployed (right three) in the Cruise KH-91-5

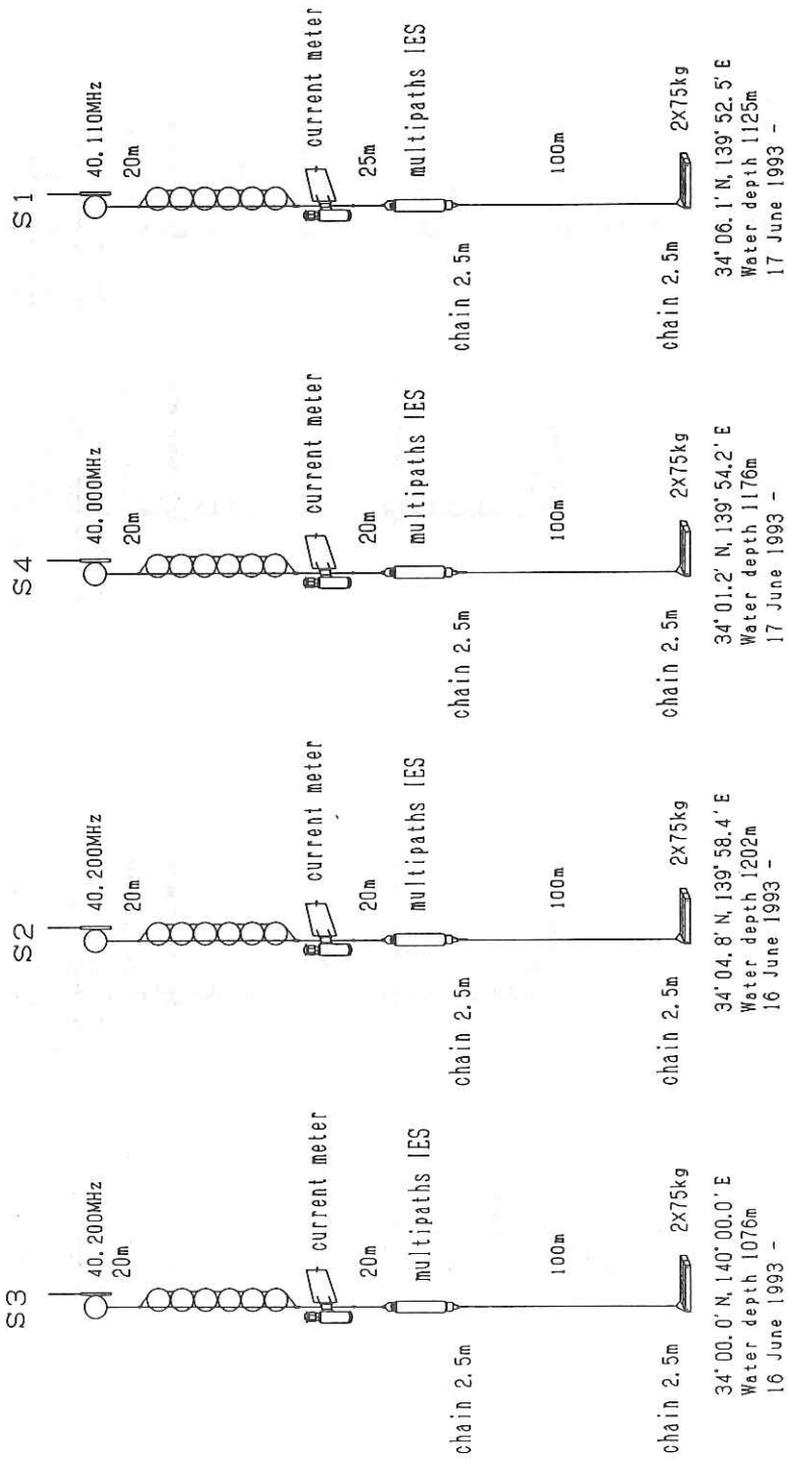

Moorings of current meter deployed on 165°E in KH-91-5 and recovered in KH-93-2. The shaded parts could not be recovered.

Moorings of current meter and thermometer deployed in KH-93-2.
 RMT: Rigogsha Memory Thermometer, RMD: Rigogsha Memory Depthmeter

Moorings of current meter recovered (left two) and deployed (right two) in KH-93-2.

Moorings of Multipath Inverted Echo Sounder and current meter deployed in KH-93-2.

The depth of XBT probe is calculated according to Hanawa and Yoritaka (1987).
The equation used here is

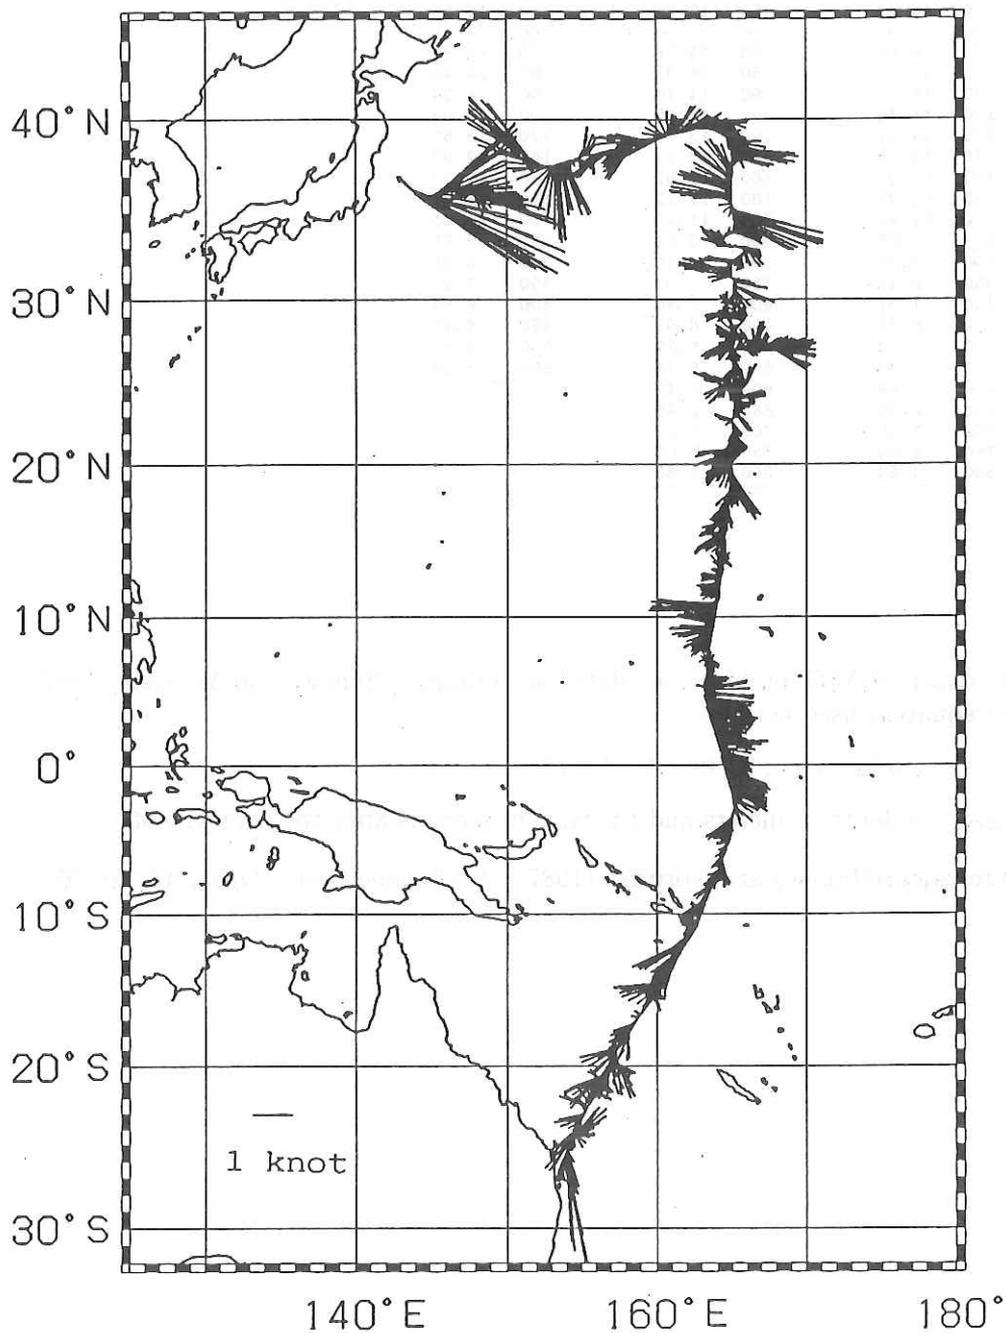

$$z = 6.715 \times t - 2.449 \times 10^{-3} \times t^2$$

where z is depth in meters and t is time in seconds after the deployment.

13. Global distribution of background aerosol particles and effects of continental aerosol particles on them
II. Measured results over the West Pacific Ocean

Kazuhiko Miura

Department of Physics, Science University of Tokyo
Shinjuku-ku, Tokyo 162, Japan

1. Introduction

Global distribution of background aerosol particles has been interested in the solar radiation and cloud physics. Because of the difficulty in the observation cover a wide area, however, reliable distribution data are limited. In the KH-89-2 expedition sailing around the world, the concentration of Aitken particles was obtained by using the automatic Pollak along latitude (Miura *et al.*, 1991). In this report, we show the measured results of aerosol particles and radon concentrations in the KH-91-5 expedition sailing along longitude 165°E.

2. Instrumentation

Collection and counting of aerosol particles, and measuring radon concentration were carried out on an upper deck 15m above the sea surface.

Aerosol particles were collected directly on a carbon-covered nitrocellulose film supported on an electron microscopic grid by using a low-pressure cascade impactor (Model I-1L, PIXE Int. Corp.). The flow rate of air was about 1 l/min and each aerosol sample was collected for 60 min. This impactor has seven stages but two stages were used in this collection. Cutoff sizes of these stages are 0.03 and 0.25 μm in radius.

Aerosol counting was carried out with two counters. Aitken particle concentrations ($r < 0.1 \mu\text{m}$) were measured with a Pollak condensation nuclei counter. Larger particle concentrations ($r > 0.15, 0.25, 0.5, 1, 2.5 \mu\text{m}$) were measured with an optical particle counter (KC01, Rion Co. Ltd.). In this report, we show the concentration of the large particles ($0.15 < r < 1 \mu\text{m}$) and the giant particles ($r > 1 \mu\text{m}$).

Origin of air mass was estimated from radon concentration. Radon concentration was obtained from concentrations of radon daughters assuming of the decay equilibrium. Radon daughters were collected for an hour on a millipore filter (HAWPO47SO, NIHON MILLIPORE KOGYO K.K.) once or twice a day and α -ray emitted from them was measured with a surface barrier detector. Collection efficiency of the filter was about 99%. Geometrical efficiency and the flow rate of air were 0.45 and about 20 l/min, respectively.

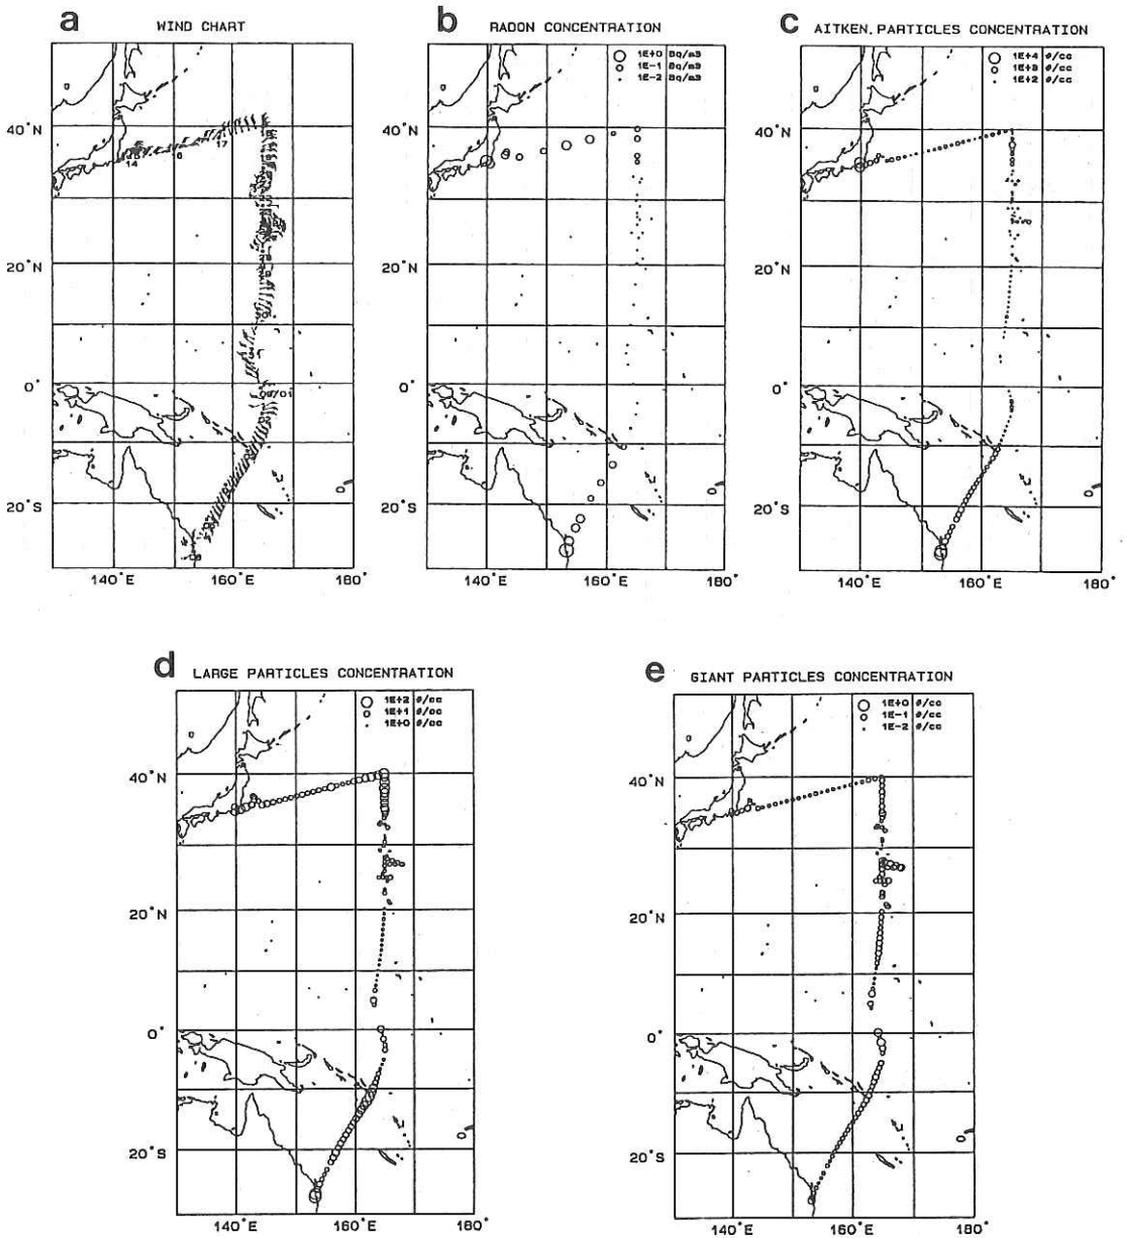

Fig. 1 Wind chart (a) and concentrations of radon (b), Aitken particles (c), large particles (d) and giant particles (e) measured on the ship from Tokyo to Brisbane.

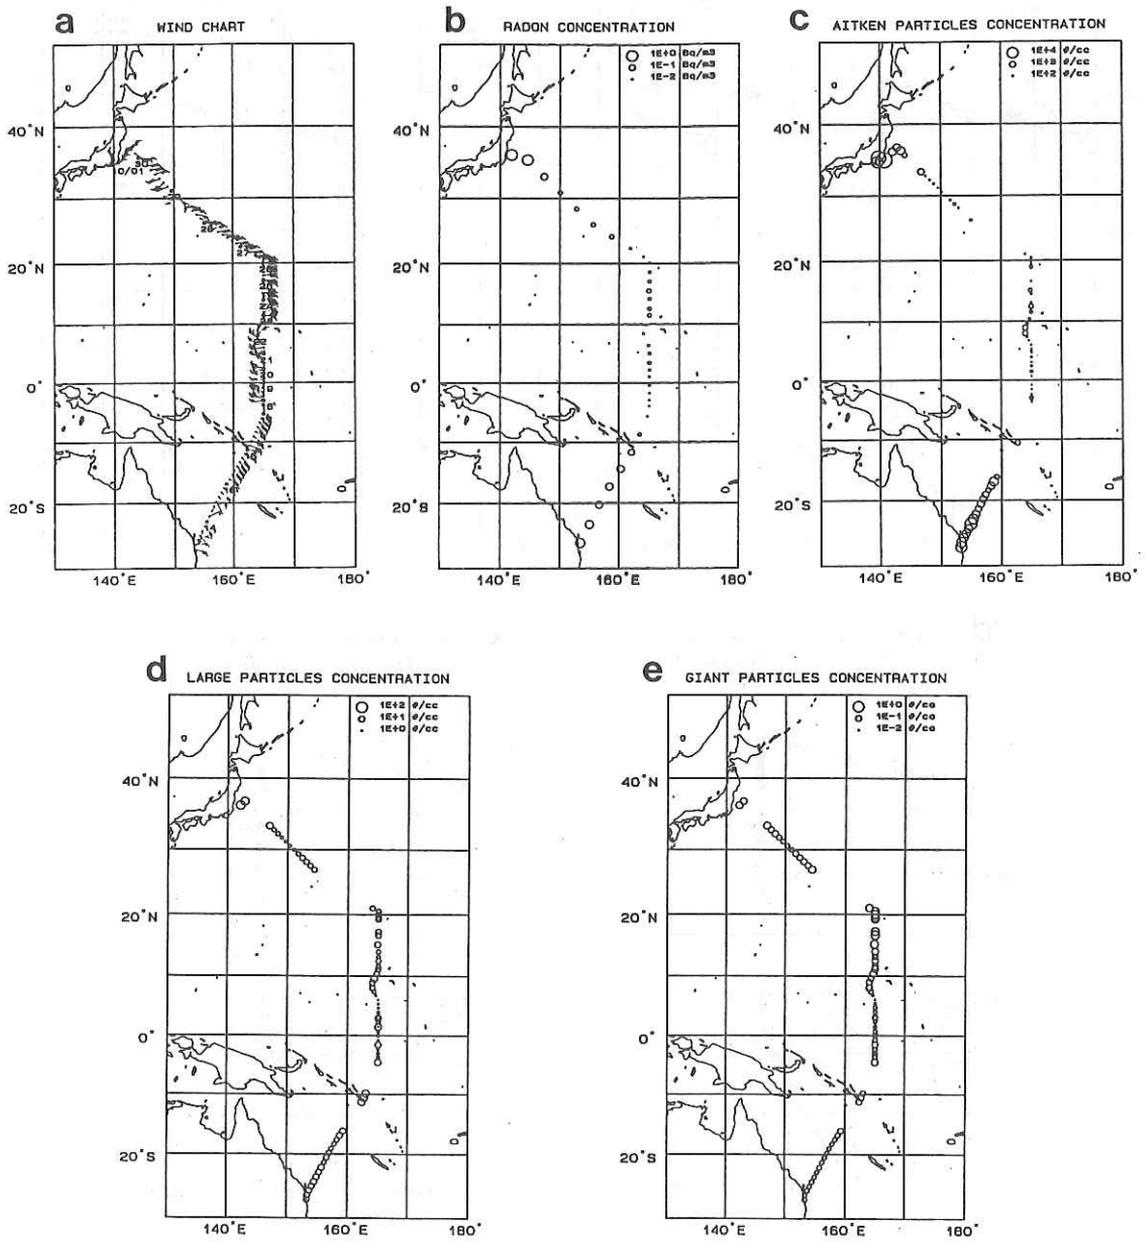

Fig. 2 Same as Fig. 1, except for the ship from Brisbane to Tokyo.

3. Results

Figures 1-(a) and 2-(a) show wind force and wind direction measured on the ship from Tokyo to Brisbane and from Brisbane to Tokyo, respectively. Dates are also shown near the positions at 00:00 GMT on the figures. Figures 1-(b) to 1-(e) and 2-(b) to 2-(e) show the measured distribution of radon and aerosol particles concentrations. Circles against aerosol concentrations were plotted every 3 hr, though we measured them every 30 min. Size of circle represents the concentration logarithmically. In order to avoid the exhaust of ship, we omitted the data measured during a calm (relative speed is less than 1 m/s) period or a period of blowing from the funnel.

In this expedition, we measured the concentration along longitude 165°E. Figure 3 shows the variation of the radon concentration and the Aitken particles concentration along the longitude. There is a good relation between two concentrations. This means that the Aitken particle is affected by continental air mass because radon exhales from soil. Ignoring the data at the south of the position in latitude 10°S, where the continental effect is significant, the concentration of Aitken particle over the South Pacific is almost the same as that over the North Pacific. This result is similar to those measured over the Central and the East Pacific by Kojima and Sekikawa (1974).

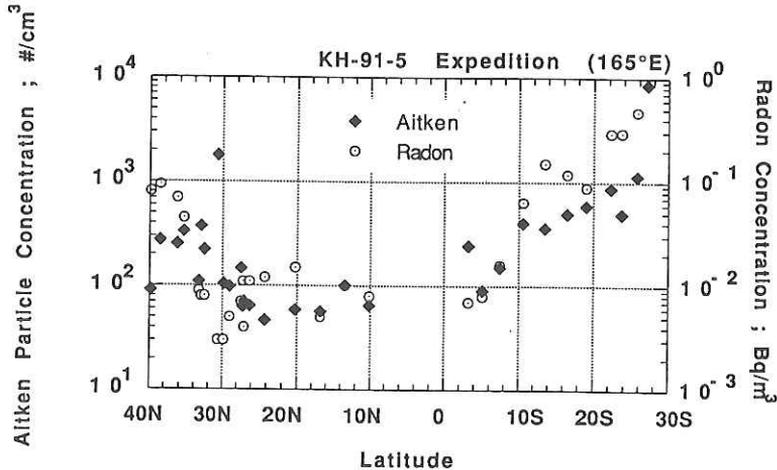

Fig. 3 The variation of the radon concentration and the Aitken particles concentration along longitude 165°E.
